*CSUN institutional data
**Baseline data per Instructions for Grant Performance Report

Explanation of Progress (Include Qualitative Data and Data Collection Information)

**Evaluation Data Sources and Methods for the Objective**
**During each of the six performance periods, we collected actual performance data on the single performance measure for this objective.  Quantitative data sources for both baseline and actual performance data for this measure are from CSUN institutional data (from CSUN's Office of Institutional Research).  During the performance periods for the six project years, we worked with CSUN's Office of Institutional Research to prepare the 2010-11 baseline data on student transfer figures for both College of the Canyons (COC) and Glendale Community College (GCC) and to produce the figures of each subsequent year of actual performance data for their respective performance periods.**

**Description of Preliminary Findings Related to the Objective**
**The baseline data for this measure (1a) is from CSUN's Office of Institutional Research and includes institutional data (i.e., not project cohort data).  Accordingly, the baseline data do not correspond to the number of project cohort participants but rather to all students who met the criteria for inclusion in the transfer cohort (see next sentence).  The 2010-11 baseline data for all Hispanic and/or low-income (i.e., Pell grant recipients) students who transferred from College of the Canyons and Glendale Community College to CSUN planning to major in a field in the College of Engineering and Computer Science follows: 14 students from College of the Canyons and seven from Glendale Community College, for a total of 21 students from both colleges.  Consequently, the target number of Hispanic and low-income students who will have transferred from College of the Canyons and Glendale Community College by Spring 2013 (two academic years from baseline) is 36, which represents an increase of 15 over the 2010-11 baseline number.  When we interpret actual performance data against the project target of 36, we find that in the first performance period, 65 students transferred from College of the Canyons and Glendale Community College in 2011-12.  That is, 65 new CSUN transfer students entered in 2011-12 from College of the Canyons and Glendale Community College planning to major in a field housed in the College of Engineering and Computer Science.  The increase in the number of new transfer students in 2011-12 (n=65) represents approximately an 81% increase over the project target (n=36).  In the third performance period, we find**

that 64 new CSUN transfer students entered in 2013-14.  The increase in the number of new transfer students in 2013-14 (n=64) represents approximately a 77% increase over the project target (n=36).  And in the final performance period, it is reported that 71 students transferred from College of the Canyons and Glendale Community College in 2016-17.  That is, 71 new CSUN transfer students entered in 2016-17 from College of the Canyons and Glendale Community College planning to major in a field housed in the College of Engineering and Computer Science.  The increase in the number of new transfer students in 2016-17 (n=71) represents approximately a 97% increase over the project target (n=36) and a 238% increase over the baseline figure (n=21) from 2010-11.  In the current performance period, we can say that this project objective has been achieved given the performance data on this measure.  Furthermore, when we interpret actual performance data during the entirety of the six-year grant period, we find that we have achieved this performance measure overall.  Across the six-year grant period, the total target number is n=216 transfer students (n=36 students/year x 6 years).  When we interpret actual performance data against the overall project target (n=216), we find that and 377 Hispanic and low-income students have transferred from College of the Canyons and Glendale Community College to CSUN, planning to major in a field in the College of Engineering and Computer Science.  The increase in the number of the new transfer students in the six-year grant period (n=377) represents approximately a 75% increase over the project target (n=216).

<u>Description of Project Activities Related to the Objective</u>
During the performance period, project faculty and staff worked to support the achievement of this objective through their efforts with cohort participants at College of the Canyons and Glendale Community College.  In the first project year, tutoring, mentoring, academic excellence workshops (COC), and textbook award programs were noted only as anticipated project activities.  Over the six years of the grant project, these activities came to fruition, in addition to many more.  These project activities included faculty mentors and project staff maintained student cohorts at both College of the Canyons and Glendale Community College.  Actual project activities offered each year at both community colleges included tutoring, mentoring, academic excellence workshops (College of the Canyons), textbook award program, joint leadership conference (College of the Canyons), joint outreach efforts (College of the Canyons), engineering boot camps (College of the Canyons), speed mentoring events (Glendale Community College), and a student organized annual Maker Faire Conference (Glendale Community College).  In addition, throughout each of the six project years, project faculty at both CSUN and College of the Canyons/Glendale Community College have worked collaboratively to support early contact and connections between community college students and CSUN, including community college cohort attendance at the annual CSUN Senior Project Design Showcase; CSUN's annual Tech Fest; an AIMS[2] social with CSUN, COC, and GCC students; other events at CSUN; and events hosted by and on Glendale Community College's/College of the Canyon's campuses for project faculty and students across institutions to attend.  Finally, during the grant period, select CSUN, Glendale Community College, and College of the Canyons cohort students participated in CSUN faculty mentor research projects during each summer session (2012, 2013, 2014, 2015, 2016, and 2017) (see "Description of Project Activities Related to the Objective" for Objective 10 below).

<u>Plans to Use of Performance Data to Monitor Progress</u>
With actual performance data for the last six project years for the performance measure of this objective, we plan to publish the figures from this year's report on our project's website (http://www.ecs.csun.edu/aims2/).  To support transfers to CSUN, we developed relationships through outreach to colleges like Los Angeles Mission College, Los Angeles Pierce College, and Moorpark Community College, from which we had participants in their Title V/HSI-STEM grant join a summer research project with CSUN AIMS[2] faculty and transfer to CSUN.

Explanation of Progress (Include Qualitative Data and Data Collection Information)

**Evaluation Data Sources and Methods for the Objective**
**The two performance measures (2a and 2b) for this objective assess the same outcome: articulated courses. In the case of this objective, an articulated course is equivalent to an articulation agreement within the context of this project. Accordingly, performance measures 2a and 2b use the same baseline data and actual performance**

data. Document data collection (e.g., of course articulation agreements) and review constitute the data collection procedures for these two performance measures of this objective. We initiated data collection for these two performance measures in February 2012 (five years prior to this performance period) and have continued data collection through the current performance period as project faculty coordinate the articulation and curriculum approval process at College of the Canyons, Glendale Community College, and CSUN. Document data analysis for these two performance measures includes reviews to confirm the status of articulated courses and articulation agreements. In addition, Glendale Community College uses an online student-transfer information system to track progress on these two performance measures (see below under "Project Activities at Glendale Community College"). Finally, we have included a discussion of course articulation, as needed, at monthly AIMS[2] project team meetings to confirm document data records at each site.

**Description of Preliminary Findings Related to the Objective**
Actual performance data for these two performance measures of this objective indicate that 77 courses articulated between College of the Canyons/Glendale Community College and CSUN. Specifically, data collected through documents reveal that a total of 41 courses articulated between College of the Canyons and CSUN and a total of 36 courses articulated between Glendale Community College and CSUN. Of the 77 courses that articulated, remedial math courses had been excluded from the count and six courses had been missing labs (four at College of the Canyons and two at Glendale Community College). Accordingly, the total of 77 courses that articulated between both community colleges and CSUN constituted the baseline performance measure. Meanwhile, a total of 12 courses had not articulated between College of the Canyons and CSUN and 17 courses had not articulated between Glendale Community College and CSUN, for a total of 29 courses in the fields of engineering and computer science. Given the project target of 15 new articulated courses, the total number of courses that needed to articulate between CSUN and the two community colleges was 92, which represented the project target number.

During each of the six project periods, faculty and staff at CSUN, COC, and GCC coordinated efforts to articulate courses. Over the course of the six project periods, particularly during the first, second, third, fifth, and sixth project periods of performance evaluation, 6 courses have been articulated between CSUN and COC and 10 courses have been articulated between CSUN and GCC, for a total of 16 articulated courses between CSUN and COC/GCC. Given the project increase of 15 and project target of 92 articulated courses/articulation agreements, the actual performance data for this period demonstrate achievement of this objective. Indeed, with the five articulated courses from the first project year, five articulated courses from the second project year, three articulated courses from the third project year, one articulated course from the fifth project year, and two articulated courses re-confirmed from the sixth project year, the total number of articulated courses at the end of the six performance periods is 93—which exceeds the project target (n=92). More specific details about the courses articulated and under review during the period can be found in the sections immediately below.

*Preliminary Findings of College of the Canyons*
During the five project performance periods, the following courses have been articulated between CSUN and COC:

CE 240 at CSUN is articulated with COC ENGR 152 (Articulated Pre-Project/Updated Project Year 2)
CMT 110/L at CSUN articulates with COC CONST 103 (Project Year 2)
CMT 208/L at CSUN articulates with COC SURV 101 (Project Year 1)
CMT 210/L at CSUN articulates with COC CONST 106 (Project Year 2)
MSE 227 and 227/L at CSUN articulates with COC ENGR 151L (Project Year 2)
ME 186/L at CSUN articulates with COC ENGR 114 (Project Year 6)

*Preliminary Findings of Glendale Community College*
During the five project performance periods, the following courses have been articulated between CSUN and GCC:

CE 240 at CSUN articulates with GCC ENGR 152 (Project Year 2)
CIT 101/L at CSUN articulates with GCC CSIS 101 or CSIS 194 (Project Year 1)
CIT 160/L at CSUN articulates with GCC CSIS 260 (Project Year 1)
CM 110/L at CSUN articulates with GCC ARCH 102 (Project Year 5)
COMP 108 at CSUN articulates with GCC CSIS 112 (Project Year 1)
COMP 122/L at CSUN articulates with GCC CSIS 165 (Project Year 1)

**COMP 256/L at CSUN articulates with GCC CSIS 125 (Project Year 3)**
**ECE 240/L at CSUN articulates with GCC ENGR 240 (Project Year 3)**
**ME 209 at CSUN articulates with GCC ENGR 156 (Project Year 3)**
**ME 186/L at CSUN articulates with GCC ENGR 111 (Project Year 6)**

**Description of Project Activities Related to the Objective**
During the first three project performance periods, project faculty made meaningful progress toward meeting these two performance measures. In fact, project faculty from CSUN, College of the Canyons, and Glendale Community College met to discuss course articulation. Since December 2011, project faculty members have met at monthly project team meetings. In fact, we have included a discussion of course articulation as a standing agenda item at monthly AIMS[2] project team meetings. At two monthly project team meetings (February 9, 2012, and March 15, 2012), project faculty established a framework to develop course articulation agreements and worked on articulating the individual courses listed above and additional courses below through the formation of work groups based on their disciplinary backgrounds and department affiliations (e.g., computer science, civil engineering and construction management, manufacturing systems engineering, etc.) and assigned themselves specific courses to review, revise, and articulate. During select monthly project team meetings of the six performance periods (February 2012 through September 2017), faculty from CSUN, COC, and GCC reported on their collaboration through the articulation process. The meetings provided an opportunity for the faculty from each campus to discuss their most recent collaborations and to report updated articulation findings. Outside of project team meetings, faculty exchanged course syllabi, course outlines, and consulted with curriculum committees on their respective campuses (COC/GCC). The articulation process included course equivalencies by examining respective course syllabi and course outlines for course descriptions, objectives/outcomes, and content for each community college course with CSUN's course.

*Descriptive of Project Activities at College of the Canyons*
In the third project performance period, College of the Canyons engineering faculty worked with CSUN faculty members to articulate one course and two labs. These included an articulation between CSUN's ME 186/L and COC's ENGR 114 and CSUN's MSE 227L and COC's ENGR 151L (completed—see above). Yet in the previous (fifth) performance period, the articulation between CSUN's ME 186/L and COC's Engineering 114 came under review. With review being completed in the current (sixth) performance period, it has been determined that these courses can now again be included in the total articulated course count and have been added back to the listing above. In addition, COC and CSUN faculty updated CE 240 and CE 240/L (CSUN) and ENGR 152 (COC) to comply with articulation requirements of SB 1440. That is, CE 240 and 240 L had been articulated prior to the start of the project, but recent changes were made to comply with the system-wide mandate (SB 1440) for transfer model curricula. Faculty in CSUN's Computer Science department are also working with faculty in COC's Computer Information Technology department to determine which courses could be developed at COC that would ease student transfer to the CSUN's computer science department. Faculty in CSUN's Construction Management department are also working with faculty in COC's Construction Management and Land Surveying departments to determine which courses could be developed at COC that would ease student transfer to the CSUN's construction management department. Articulations include Construction-103 and CSUN's CMT110/L, COC's Construction-106 and CSUN's CMT210/L, and COC's Surveying-101 and CSUN's CMT208/L (see above). These faculty-faculty conversations about articulation issues have yielded multiple course pathways so that community college students can successfully complete key lower-division courses prior to transfer. We measure the progress made during these discussions on the articulation of courses between COC and CSUN by monitoring the development of Memoranda of Understanding (MOUs) between individual departments at the two campuses. We also track the articulated courses in the curriculum approval process at COC and the number of fully articulated courses through a record of curriculum committee meetings.

*Descriptive of Project Activities at Glendale Community College*
In the previous (fifth) performance period, Glendale Community College faculty and staff coordinated with CSUN faculty to articulate GCC's ARCH 102 and CSUN's CM 110. Meanwhile, in the performance period for the third project year, Glendale Community College faculty worked with CSUN faculty to finalize the articulation of three courses. These included course articulations between CSUN's COMP 256L and GCC's CSIS 125, CSUN's ECE 240L and GCC's ENGR 240, and CSUN's ME 209 and GCC's ENGR 156 (completed—see above). In the second project performance period, GCC faculty worked with CSUN faculty members to articulate CSUN's ME 186/L and GCC's ENGR 111. Yet in the previous (fifth) performance period, the articulation between CSUN's ME 186/L and GCC's ENGR 111 came under review. With review being completed in the current (sixth) performance period, it has been determined that these courses can now again be included in the total articulated course count and have been added back to the listing above. We should also note that the course articulation between CSUN's MSE 227 and GCC's ENGR 146 from the second performance period has come under review and is not currently included in the total count. With some courses that articulated between CSUN and GCC, Professor Rubke and Professor Voden from GCC collaborated closely with several of the courses; however, the curriculum committees at their college also provided input into the articulation process. Professor Melara from CSUN updated and articulated the computer science courses through her requests of each course syllabi.

**Plans to Use of Performance Data to Monitor Progress**
As with the courses articulated during all six of the performance periods, we plan to continue the documentation of course articulation work that supports our collaborative approach in the curriculum revision process and submission of revised courses to curriculum committees at our respective campuses once courses have been articulated.

Explanation of Progress (Include Qualitative Data and Data Collection Information)

**Evaluation Data Sources and Methods for the Objective**
**College of the Canyons and Glendale Community College report their respective data sources and methods below.**

*Evaluation Data Sources and Methods at College of the Canyons*

College of the Canyons used a combination of document data sources and collection methods—including counseling appointments, student educational plans, and attendance at the transfer planning events—to establish baseline data for these performance measures.

*Evaluation Data Sources and Methods at Glendale Community College*
Throughout the grant period, Glendale Community College STEM and general counselors were asked to track and report any STEM professional development workshops they attended to the AIMS$^2$ Counselor/Coordinator. The AIMS$^2$ Counselor/Coordinator also tracked counseling appointments, including meetings to discuss student educational plans. An online student survey was also administered to gather additional information in regards to AIMS-related services utilized by students.

**Description of Preliminary Findings Related to the Objective**
Preliminary findings for each college are reported below.

*Preliminary Findings of College of the Canyons*
For performance measure 3a, College of the Canyons reports that two (2) counselors have participated in staff development activities. Also, during this performance period, we supported one (2) of our counseling faculty members, along with students, on two trips to participate in the Society for Hispanic Professional Engineers (SHPE) conference, SHPE Region 2 Retreat and Great minds in STEM (HENAAC) conference so that they will have the tools that they need to successfully prepare our AIMS$^2$ scholars for transfer. Given actual performance data, performance measure 3a has been achieved during the period.

With respect to performance measure 3b, we see that Cohort 5 (n=13) had a total of 23 counseling contacts with AIMS$^2$ counselor(s) during the performance period. These numbers were based on Counseling Appointments, Student Ed Plan sessions and transfer planning events for a total of 23 sessions with students in Cohort 5. We monitored the amount of progress toward the above objectives by tracking the number of counseling appointments and the number of SEPs created or modified and attendance at the transfer planning events. Given actual performance data, performance measure 3b has been achieved for Cohort 5 during the period. All of our Cohort 5 transferred at the end of Spring 2017 leading to the success of completion with the assistance of our academic counseling.

*Preliminary Findings of Glendale Community College*
3a) In project years 1, 2, 3, 4, and 5, two (2) counselors attended STEM workshops and/or conferences, meeting the number set as the target. Over the 6 years of the grant project, these professional development opportunities have included the annual SHPE (Society for Hispanic Professional Engineers) National Conference (held in November) the annual SHPE Regional conference (held in April), the GreenTech Summit Conference, the Southern CIAC bi-annual conference, STEMTech, the Great Minds in STEM conference, and the California Community College Associate for Occupational Education workshop. Given actual performance data, performance measure 3a has been achieved during the grant period.

3b) The AIMS$^2$ Counselor/Coordinator recorded 257 counseling sessions with students during 2015/16 for an average of 15 counseling sessions per student. The AIMS$^2$ Counselor/Coordinator recorded 22 counseling sessions with students (Cohort 1 students n=15) during 2011/12 for an average of 1.5 counseling sessions per student. The AIMS$^2$ Counselor/Coordinator recorded 24 counseling sessions with Cohort 2 students (n=9) for an average of 2.6 counseling session per student, and 35 counseling sessions with Cohort 3 students (n=13) for an average of 2.7 counseling sessions per student. Over the course of the grant project, the average number of counseling sessions has increased.

**Description of Project Activities Related to the Objective**
Specific project activities at College of the Canyons and Glendale Community College, respectively, are detailed below.

*Project Activities at College of the Canyons*
During this performance period, our counseling plan has included having our AIMS$^2$ scholars meet with counseling faculty one to two times a semester for every semester they have been involved in the program at COC. These appointments have resulted in the development of a Student Educational Plan (SEP) for each scholar. Our counselors have also provided informational workshops on transfer planning during the fall semesters to support the scholars' transfer process. The counselors have supported and answered direct questions related to course transferability for a smooth transition to a four year university.

*Project Activities at Glendale Community College*

Students participating in the program are required to meet one-on-one with the AIMS[2] Counselor/Coordinator at least once per semester, but most met with the counselor multiple times.  During these sessions, students develop or update their Student Educational Plans (SEP) and are advised on prerequisite courses.  The following comments from students indicate the helpfulness of the AIM counselors:

"What I liked about AIMS is the fact that we as a group kind of became a family, as students and professors. Also, knowing the fact that I have a counselor such as Dr. Cortes and Marisela for guidance when I need advice about classes or other academic matters is a huge ease at mind being a student, especially when feeling lost or out of options about choices."

"I really like about it is we have support from counselors."

"They [counselors] make sure that we stay full time. He makes sure that we keep our GPA, and make sure that we will be in all of our classes."

"Not enough could possibly be said about the usefulness of this program. The support services and academic enrichment provided are invaluable. Constantly challenging us with new experiences created an enriching environment that manifested itself in academic persistence and achievement."

<u>Plans to Use of Performance Data to Monitor Progress</u>
At College of the Canyons, progress toward the above performance measures of this objective has been tracked through the number of counseling appointments, the number of SEPs created or modified, and attendance at the transfer planning events.  Meanwhile, At Glendale Community College, progress toward the above performance measures of this objective has been tracked by the number of counseling sessions students have, results from a survey, and recording counselor(s) attendance at professional development workshops.

*****Numbers reported cannot be disaggregated per cohort and are combined for the two cohorts of students enrolled in Project Year 5.

******Note that Glendale Community College reported that two cohort participants (cohort unknown) enrolled in an online course in Year 6

Explanation of Progress (Include Qualitative Data and Data Collection Information)

**Evaluation Data Sources and Methods for the Objective**
**College of the Canyons and Glendale Community College report their respective data sources and methods below.**

*Evaluation Data Sources and Methods at College of the Canyons*
**College of the Canyons collected data on student participation in tutoring sessions and workshops through an existing MESA program tracking mechanism.**

*Evaluation Data Sources and Methods at Glendale Community College*
**A tutoring log is maintained by the counselors who document the number of tutoring sessions that occur. Glendale Community College also uses an online student survey to document the types of services and programs students participated in during the academic year.**

**Description of Preliminary Findings Related to the Objective**
**Preliminary findings for each college are reported below.**

*Preliminary Findings of College of the Canyons*
**We developed a tracking mechanism for our AIMS$^2$ student cohort in order to quantify their time with both peer and faculty tutors. For performance measure 4a, given current baseline data reported by College of the Canyons, project targets have been established that are intended to achieve the percent increase in both performance measures related to increases in the number of students (not sessions or workshops) that participate in tutoring (4a), workshops (4a), and online classes (4b). Accordingly, the current target for performance measure 4a and 4b for Cohort 5 (i.e., 9/13 or 69% of all Cohort 5 participants for 4a and 5/13 or 33% of all Cohort 5 participants for 4b). In terms of actual performance data, College of the Canyons reports that 10 total students participating in Cohort 5, or 10/13 (77%), have sought tutoring with a faculty or student tutor—related to measure 4a. Given actual performance data for Cohort 5, performance measure 4a has been achieved during this period. Because of the financial situation for our AIMS$^2$ scholars it is difficult for them to enroll in university courses while they are still at College of the Canyons. Accordingly, for performance measure 4b, College of the Canyons reports that 8/13 (61.5%) students in Cohort 5 enrolled in online courses during cohort participation—therefore this performance measure has been achieved.**

*Preliminary Findings of Glendale Community College*
**To document participation in tutoring (4a), academic workshops (4a), and online courses (4b), information was collected from an in-class online student survey. In project year 5, fifteen (15) students participated in the survey (response rate = 88%). Eleven students (73%) participated in STEM-related tutoring sessions and all attended multiple tutoring sessions. Ten of these students (67%) also participated in STEM-facilitated academic workshops with 8 out of the 10 attending multiple workshops.**

**In project year 5, five (5) students reported enrolling in an online course at any college or university. In project year 6, two (2) students (cohort unknown) reported enrolling in an online course at GCC. This adds up to a total of 7 students (n=7) enrolling in an online course in the last two project years. This number demonstrates an improvement over the first three project years where a total of four (n=4) students enrolled in an online course.**

**Description of Project Activities Related to the Objective**
Specific project activities at College of the Canyons and Glendale Community College, respectively, are detailed below.

*Project Activities at College of the Canyons*
We produced a full drop-in tutorial schedule including math, engineering, chemistry and physics with faculty tutors and student peer tutors available for our AIMS$^2$ scholars. During this performance period, we utilized this drop-in tutorial schedule for math, engineering, chemistry and physics. There are twenty-seven hours of engineering tutoring, twenty-seven hours of physics tutoring, forty-two hours of mathematics tutoring and thirty-nine hours of chemistry tutoring with faculty and student tutors available for our AIMS$^2$ scholars. We increased our hours of tutoring to accommodate more students and increase completion rates. Because of the financial situation for our COC AIMS$^2$ scholars it has been difficult for them to enroll in courses at CSUN while they have still been at College of the Canyons.

*Project Activities at Glendale Community College*
Glendale Community College students were offered tutoring as well as STEM-facilitated academic workshops. The AIMS$^2$ Counselor/Coordinator reminded students of the tutoring support available and their requirement to seek tutoring services. 75% of students stated that tutoring was helpful. Comments from students regarding the tutoring were overwhelmingly positive:

"The tutor was knowledgeable and patient when tutoring me."

"He helps me organize the material."

"Improved test scores and understanding of material."

**Plans to Use of Performance Data to Monitor Progress**
At College of the Canyons, progress toward the above performance measures of this objective have been tracked using a tracking mechanism. Meanwhile, Glendale Community College has monitored performance on these two measures using the online survey results.

Explanation of Progress (Include Qualitative Data and Data Collection Information)

**Evaluation Data Sources and Methods for the Objective**
**College of the Canyons and Glendale Community College report their respective data sources and methods below.**

*Evaluation Data Sources and Methods at College of the Canyons*
**COC used a survey questionnaire to establish the baseline data regarding faculty contact. During the course of this performance period, all COC faculty contacts were recorded. Interactions with CSUN faculty and students through summer research opportunities were are also recorded.** *Note that these data sources for performance measure 5b may differ from data sources for participation in summer faculty research reported below. For the latter, CSUN faculty mentors reported student participants in summer research.*

*Evaluation Data Sources and Methods at Glendale Community College*
**Glendale Community College used an online student survey and information gathered from student focus groups to collect data on student-faculty interactions. The quality of interactions was not documented because there were no reported interactions during the school year.** *Note that these data sources for performance measure 5b*

*may differ from data sources for participation in summer faculty research reported below.  For the latter, CSUN faculty mentors reported student participants in summer research.*

<u>Description of Preliminary Findings Related to the Objective</u>
**Preliminary findings for each college are reported below.**

*Preliminary Findings of College of the Canyons*
**For performance measure 5a, College of the Canyons is working to strengthen its schedule of appointments for our engineering faculty to spend one-on-one time with each member of our AIMS$^2$ student cohorts as well as provide professional development workshops related to math anxiety, financial aid, and summer research experience.  Each student will be scheduled for monthly one-on-one time with faculty in the engineering department to discuss their academic goals, their professional aspirations, and the barriers they may face along the way.  During this reporting period, 43 faculty-student interactions in Cohort 5 were made.  When we examine the total number of interactions by student headcount, we find that 10/13 (Cohort 5) students interacted with faculty.  We recorded students scheduling one-on-one meetings with faculty in the engineering department to discuss their academic goals, professional aspirations, and barriers to academic success; we also made note of those students who attended at least one of our workshops.  Given baseline data for Cohort 5 (n=0)—for performance measure 5a, we see that actual performance data allows us to conclude that this performance measure has been achieved.**

**In terms of performance measure 5b, during the summer of 2016, 3/13 Cohort 5 students were involved with hands-on research with CSUN faculty and students as well as GCC, Mission, Moorpark, and Pierce students. The research lasted for a period of 8-10 weeks.  Overall, the quality of interactions between students and faculty improved for all participants of Cohort 5 (n=3/13).**

*Preliminary Findings of Glendale Community College*
**In project year 5, five (5) out of 15 (33%) Glendale Community College AIMS$^2$ students reported that they interacted with a faculty member who provided them with career support and academic expertise.  Interactions included: office hour visits (3 students), email communication (2 students), communication by phone (1 student), and out-of-class discussions/meetings (3 students).**

**For performance measure 5b (quality of student-CSUN faculty interactions), the AIMS$^2$ participants did not have access to CSUN faculty during the academic year. There were summer research opportunities that some students participated in, but their participation was not captured on the survey administered at the end of the academic year.**

<u>Description of Project Activities Related to the Objective</u>
**Specific project activities at College of the Canyons and Glendale Community College, respectively, are detailed below.**

*Project Activities at College of the Canyons*
**At College of the Canyons, each student was scheduled for monthly one-on-one time with faculty in the engineering department to discuss their academic goals, their professional aspirations, and the barriers they may face along the way.  This chance to interact informally with CSUN faculty and learn about their research will provide a unique experience for College of the Canyons AIMS$^2$ students.  We tracked the number of faculty/scholar appointments and scholar participation in CSUN faculty events at COC and resulted in 10/13 student interactions with faculty in engineering increased from the previous semester of 7/13 in Fall 2016.**

*Project Activities at Glendale Community College*
**Opportunities to interact with GCC and CSUN faculty were provided to AIMS$^2$ students.  Guest speakers, as well as faculty from GCC and CSUN, attended the club's monthly sessions and shared information with participants on a range of STEM issues and disciplines.  Throughout the program, we were lucky to have the speakers and networking opportunities for our students such as: Heidi Arriola (Envirogen Sales Engineer), Frank Barragan (Founder of Adlincio, Inc), and Brian Vasquez (East Los Angeles College Engineering Professor).**

*Summer Project Research Activities at CSUN*

In addition to the project activities included above under College of the Canyons and Glendale Community College, CSUN faculty mentors facilitated interaction between themselves and COC and GCC students, as well as students from three other community colleges during the performance period. Specifically, select CSUN faculty mentors invited COC, GCC, Los Angeles Mission College (Mission), Los Angeles Pierce College (Pierce), Moorpark Community College (Moorpark) and/or Los Angeles Valley College (Valley) students to join CSUN students in faculty research projects at CSUN with CSUN faculty mentors in Summer 2017. The CSUN faculty mentors, research project names, and number of students (COC, GCC, Mission, Moorpark, Pierce, Valley, and CSUN) who participated in the projects are listed below:

**Professors Behzad Bavarian and Lisa Reiner:**
"Application of High Strength Aluminum Alloys for Aircraft Applications," "Corrosion Protection of Steel Pipes/Reinforced Concrete Structures Using Corrosion Inhibitors," and "Application of Low Melting Point Materials for Soldering" with 1 COC student and 2 CSUN students.

**Professor Bruno Osorno:**
"Electric Speed Drives Technology in Transportation (ESDTT)" with 1 GCC students and 2 CSUN students.

**Professor Vidya Nandikolla:**
"Eco Four-Wheel Drive," and "Autonomous Drone" with 1 GCC student, 1 Moorpark student, and 2 CSUN students.

**Professors Tzong-Ying Hao and Anwar Alroomi:**
"The Impact of a Team-Based, Experimental Research Project on Undergraduate Engineering Retention Rate" with 1 COC student, 1 GCC student, and 1 Moorpark student.

**Professors Tadeh Zirakian and David Boyajian:**
"Augmentation of a Structural Engineering Encounter (SEE) Active-Learning Laboratory Environment: Phase I" with 1 COC student and 3 Pierce students.

**Professor Vahab Pournaghshband:**
"Detection of Network Traffic Interference by Intermediaries on the Internet" with 2 COC students and 2 CSUN students.

**Professor Ruting Jia:**
"Solving Real World Problems by Using Intelligent Control Techniques" with 1 COC student and 1 GCC student.

**Professor S. Jimmy Gandhi:**
"Creation of an Entrepreneurial Mindset Among Undergraduate Students" with 2 COC students, 4 Pierce students, and 1 CSUN student.

**Professor John Valdovinos:**
"Low-Profile Wireless Power Receivers for Pediatric Circulatory Blood Pumps" with 1 CSUN student.

**Professor Bingbing Li:**
"Customized Orthodontic Brackets Created by Selective Laser Melting Process for Orthodontic Treatment," and "3D Bioprinting of Aneurysm Blood Vessel" with 1 COC student, 1 GCC student, 1 Moorpark student, and 1 Valley student.

**Professor Durgesh:**
"Experimental Study of Airfoils in the Wake of a Bluff Body" with 2 Pierce students.

When considering the overall grant project period, a total of 176 students across 64 separate or discrete research projects were provided the opportunity to interact with CSUN faculty, CSUN students, and COC/GCC students through their participation. And of those 176 participating students, there were 28 students from COC and 36 students from GCC.

**Summer Research Participants Throughout the Grant Period**

| Year | COC | GCC | Mission | Moorpark | Pierce | Valley | CSUN | Total |

**In terms of the performance measures of this objective, these projects facilitated interaction between CSUN faculty, CSUN students, and COC/GCC students within a research context and supported the achievement of the objective.**

**Plans to Use of Performance Data to Monitor Progress**
**At College of the Canyons, progress toward the performance measures of this objective has been tracked using a survey, faculty/scholar appointment records, records of counseling contacts and scholar participation in COC and CSUN events and research opportunities. Glendale Community College monitored performance on these two measures through the use of results from the online survey and group interviews (i.e., participant focus groups). Specifically, Glendale Community College has collected data on the quality of student-faculty interactions through student participant focus groups and a follow-up online survey. For the student focus groups, a protocol was used to inquire about students' experiences in interacting with CSUN faculty, the frequency of interactions, the types of interactions, and what was most and least beneficial about the support they received. The focus groups were led by the program evaluators and audio recorded as well as have handwritten notes taken during the discussion.**

Explanation of Progress (Include Qualitative Data and Data Collection Information)

**Evaluation Data Sources and Methods for the Objective**
**During the performance period, College of the Canyons and Glendale Community College supported the evaluation of these measures through data collection methods designed to meet their unique project needs.**

*Evaluation Data Sources and Methods at College of the Canyons*
**College of the Canyons collected data on student participation in tutoring sessions, AIMS$^2$ activities and the tutor/mentor training workshop through existing tracking and recording mechanisms.**

*Evaluation Data Sources and Methods at Glendale Community College*
**Glendale Community College used an online survey questionnaire and focus groups to collect data on these performance measures.**

**Description of Preliminary Findings Related to the Objective**
**Preliminary findings for each college are reported below.**

*Preliminary Findings of College of the Canyons*
During this performance period, a total of 140 hours in STEM tutoring in, chemistry, engineering, physics, and mathematics were provided by both faculty and student tutors. On average each week there were forty one hours of tutoring in chemistry, physics, and mathematics. In addition to one-on-one tutoring, there were 6 AEW workshops each week in chemistry, physics and math. Attendance at these workshops was as follows:

Chem 202 (General Chemistry II): 18 student participants/3 AIMS[2] scholars
Chem 255 (Organic Chemistry I): 12 student participants/5 AIMS[2] scholars
Chem 256 (Organic Chemistry II): 14 student participants/4 AIMS[2] scholars
Math 212 (Calculus II): 9 student participants/2 AIMS2[2] scholars
Math 215 (Differential): 7 student participants/2 AIMS[2] scholars
Physics 221 (Electricity & Magnetism): 12 student participants/1 AIMS[2] scholar

During the performance period, - 13 of the students in Cohort 5 participated in tutoring or academic workshops (see performance measure 4a). Given project targets, we can conclude that, project respective targets for cohort 5 have been met this performance period. In terms of peer mentoring (performance measure 6b), College of the Canyons reports that in Cohort 5 2 students participated in peer mentoring by CSUN students during the period—so this performance measure has not been achieved for either cohort during the period, although there was some progress with Cohort 5. In terms of performance measure 6c, qualitative data on the quality of peer (student-student) interaction was recorded and resulted in all participants involved with peer to peer interactions.

*Preliminary Findings of Glendale Community College*
Throughout the grant period, for performance measure 6a (participation in peer-peer tutoring), all Glendale Community College students were encouraged to partici-pate in tutoring to increase their math, science and language skills. At the beginning of the grant period, in 2011-12, eleven (11) out of nineteen (19) students reported participating in peer tutoring. In the last years of the grant period, in 2015-16, five (5) out of 15 students reported participating in peer-peer tutoring. The subject that students requested the most tutoring in was mathematics, followed by science. With respect to performance measure 6b (peer mentored by CSUN students), at the time the students were surveyed during performance year 5, no (0) students reported having a peer mentor from CSUN. This was clearly a challenge during the academic year.

Also in project year 5, for performance measure 6c (quality of peer interactions), survey and focus groups responses revealed a large majority of positive student com-ments on the strength and quality of the relationships built though the program. The following are selected examples:

"I loved interacting with people who are just like me, trying to become an engineer. Watching them succeed allowed me to take similar steps to allow myself to have a better chance at becoming a success in STEM."

"I really enjoy being part of this group because my previous educational experience I was surrounded by people who did not have a desire to push themselves harder…being surrounded by these individuals who are constantly pushing themselves inspired me to push myself even further and even harder because I enjoy always striving to go beyond my limits, and it's nice to be surrounded by people who have the same drive and motivation that I have."

"I liked the support and encouragement of faculty and other peers."

<u>Description of Project Activities Related to the Objective</u>
College of the Canyons and Glendale Community College, respectively, report specific project activities in detail both immediately above and below.

*Project Activities at College of the Canyons*
During this performance period, College of the Canyons established a drop-in tutorial schedule for math, engineering, and physics hosted by faculty and students. Col-lege of the Canyons project faculty and staff are currently developing additional training workshops for peer tutors and, as mentioned earlier, are developing a tracking mechanism for AIMS[2] scholars using peer tutors. With regard to this performance measures, COC's AIMS[2] scholars have participated in the following activities:

**MESA STEM Week**
**Company tour to NASA/JPL**
**Various presentations from the following companies – Amgen, NASA/JPL, Boston Scientific and two alumnus.**

**We tracked all scholar interactions with peer mentors from both COC and CSUN.  We are developed additional training workshops for peer tutors and as mentioned earlier have developed a tracking mechanism for AIMS$^2$ scholars using peer tutors.**

*Project Activities at Glendale Community College*
**Throughout the grant period, Glendale Community College students were provided many opportunities for peer-peer interaction by way of club meetings, field trips, and club projects. Students met monthly for one hour in a club capacity to work as a team to tackle real, tangible, and ambitious projects, as well as enhance their knowledge of STEM through guest speakers. Peer interactions were also encouraged and strengthened during field trips, networking events, conference attendance, and class projects.  One that has the biggest turnouts has consistently been the annual national Society of Hispanic Professional Engineers (SHPE) conference, which takes place in November.  Other big events in which students took part were the Hispanic Engineer National Achievement Awards Corporation (HENAAC) conference (held annually in October), GCC Manufacturing Day (October), Robotics Academy Maker Faire (February), and the annual regional SHPE conference (held in April).**

**Plans to Use of Performance Data to Monitor Progress**
**At College of the Canyons, progress toward the above performance measures of this objective have been tracked using a tracking mechanism.  Meanwhile, Glendale Community College has monitored performance on these two measures using the online survey results.**

| | | 6 | | 21/68 | 30.9 | | 85/237 | 35.9 |

*CSUN institutional data
**Note that in the ratio columns of the target and actual performance data "the numerator represents the numerical target (e.g., the number of students that are expected to attain proficiency) or actual perfor-mance data (e.g., the number of students that attained proficiency), and the denominator represents the universe (e.g., all students served)" (Instructions for Grant Performance Report, p. 7).
***Baseline data per Instructions for Grant Performance Report

Explanation of Progress (Include Qualitative Data and Data Collection Information)

**Evaluation Data Sources and Methods for the Objective**
**During each performance period, we collected actual performance data on the single performance measure for this objective.  During the performance period of the first project year (2012-2013), we collected baseline data for the performance measure.  Quantitative data sources for both baseline and actual performance data for this measure are from CSUN institutional data (from CSUN's Office of Institutional Research).  During the performance periods for all six project years, we worked with CSUN's Office of Institutional Research to prepare the 2010-11 baseline data on student transfer figures for both College of the Canyons (COC) and Glendale Commu-nity College (GCC) and to produce the figures of actual performance data in each of the subsequent years: 2011-12 (Year 2), 2012-13 (Year 3), 2013-14 (Year 4), 2014-15 (Year 5), and 2016-17 (Year 6).**

**Description of Preliminary Findings Related to the Objective**
**The baseline data for this measure is from CSUN's Office of Institutional Research and includes institutional data (i.e., not project cohort data).  Accordingly, the base-line data do not correspond to the number of project cohort participants but rather to all students who met the criteria for inclusion in the transfer cohort (see next sentence).  The baseline data for Hispanic and/or low-income students in engineering and computer science at CSUN indicates that the three-year program completion (i.e., graduation) rate for the most recent entry term (Fall 2007) at project formation for Hispanic and/or low-income (i.e., Pell grant recipients) transfer students plan-ning to major in a field in the College of Engineering and Computer Science was 26.5% (18/68).  This program completion rate—26.5%--comprises the baseline data for the project and the basis for which the project target of 30% is set.  Given the project target increase, the project target number of students who graduate is 21/68 (or**

just over 30%--30.9%).  When we look at project year 1 and interpret actual performance data against the project target of 30.9% (21/68), we find that 29.3% (22/75) completed a degree program (entry term Fall 2008). In the first project year the project target was not met, although substantial progress had begun.  This progress lead to increased measurable outcomes in subsequent years.  Thus project Year 3 proved one of the strongest years for Hispanic and/or low-income students graduating in engineering and computer science at CSUN where  39.7% (25/63) completed a degree program (entry term Fall 2010) within three years. And in the final project year 6, we find that this project target (21/68 or 30.9%) was again exceeded with 35.9% (85/237) completing a degree program for the most recent period for which institutional data are available (entry term: Fall 2013).  That is, in project year 6, of the 237 Hispanic and/or low-income transfer students planning to major in a field in the College of Engineering and Computer Science who entered in Fall 2013, 85 students completed a program of study within three years, for a total of 35.9% of all students in the entry cohort.  Overall, this final project year 6 figure represents over a six percentage point increase over the Fall 2008 data (reported in the performance period for the first project year) of 29.3% (22/75) and an increase from last project year's data (i.e., fifth project year) of 31.4% (n=49/156) from the Fall 2012 entry cohort.  While across all six project years there is a mixed pattern in terms of the percentage of students completing a degree program, we see a consistent improvement over the base-line in the overall number of students completing a program of study—from 18 in the 2010-11 period to 60 in the third project year's performance period to 85 in this final year's performance period.  Overall—given the project target—we can conclude that we have exceeded the baseline and target measure for the performance measure of this objective.

**Description of Project Activities Related to the Objective**
During the performance period, and across the entirety of the grant project period, project faculty mentors and staff worked to support this project objective.  For example, faculty mentors met regularly with their cohort participants to establish a faculty mentoring relationship and coordinate project activities with cohort partici-pants, including cohort meetings and research project groups.  Project activities that have taken place over the six-year project period include the following: participa-tion in CSUN's Tech Fest and Senior Design Project Showcase, peer tutoring, participation in undergraduate research projects with faculty, projects or activities in an instructional lab of the faculty mentor, and introduction to an appropriate professional society student chapter in a discipline of the faculty mentor.  In addition, project staff facilitated student participation in national organizations for Latino/a students, including ASHIE (Alliance of HSI Educators), SHPE (Society for Hispanic Profes-sional Engineers), HACU (Hispanic Association of Colleges and Universities), and HENAAC (Hispanic Engineer National Achievement Awards Corporation).

**Plans to Use of Performance Data to Monitor Progress**
With both baseline and actual performance data for the performance measure of this objective, we plan to publish the figures from this year's report on the AIMS[2] project website (http://www.ecs.csun.edu/aims2/).

Explanation of Progress (Include Qualitative Data and Data Collection Information)

**Evaluation Data Sources and Methods for the Objective**
During the project period, we collected baseline and actual performance data for these two measures through a combination of document data, student recruitment/application interviews (open-ended questionnaire), and student structured journal sources.  Previously, during the performance period of the first project year, we collected baseline and actual performance data for the first objective (8a) through document data collection in Spring 2012, and continued collection of actual performance data for the remaining project years utilizing document data collection.

For the second project objective (8b), we collected baseline data for Cohorts 1, 2, 3, 4, 5, 6, and 7 for the second objective (8b) in the CSUN student recruitment process/questionnaire administration in late Fall 2011/early Spring 2012 (Cohort 1), late Spring 2012/early Fall 2012 (Cohort 2), late Spring 2013/early Fall 2013 (Cohort 3), late Fall 2013/early Spring 2014 (Cohort 4), late Summer 2014/early Fall 2014 (Cohort 5), and questionnaire administration for Cohort 6 in late Summer 2015/early Fall 2015 and Cohort 7 in late Fall 2016/early Spring 2017.  During baseline data collection for each cohort, we asked cohort participant applicants the number of academic advising sessions that they had attended in the term immediately prior to the formation of their cohort in Spring 2012 (Cohort 1), Fall 2012 (Cohort 2), Fall 2013 (Cohort 3), Spring 2014 (Cohort 4), Fall 2014 (Cohort 5), Fall 2015 (Cohort 6), or Fall 2016 (Cohort 7).  In addition, we collected actual performance data from all cohorts during each performance period through document (structured journal) data collection, which cohort participants completed on a monthly basis and submitted in the Moodle (online) project site.  Student journaling occurs through student completion of an electronic journal form with items related to project outcomes, including an item related to the number of academic advising sessions for the month.  That is, students complete and submit an electronic journal entry related to academic advising (and other project activities) by the end of the month or the beginning of the next month.  Once submitted, journal entry data extracts in Excel occurred, followed by a tabulation of the aggregate number of counseling sessions.

**Description of Preliminary Findings Related to the Objective**
*Preliminary Findings for Performance Measure 8a*
With respect to the first performance measures (8a) for this objective, baseline data reveal that CSUN's College of Engineering and Computer Science had three full-time staff academic advisors in 2010-11.  Given that the college had three staff academic advisors prior to the project, the project target is four total academic advisors.  During the first project year (2012-13), we augmented the academic advising capacity of the college through the seven faculty mentors who offer academic advising to the cohort participants.  Further, actual performance data for the first performance measure (8a) demonstrate that, during the first project performance period (2012-13), we met the project target and achieved this component of the project objective with the addition of one new staff academic advisor to the college.  This academic advising position has been filled continually since its addition in the first project performance period.  The current staff academic advisor works with the student services office of the college and coordinates project activities related to cohort participant advising.  With the addition of this academic advisor, the college now has four staff academic advisors in total, one above the baseline data.  Given the actual performance data (n=4) and the project target (n=4), we have met this performance measure of the objective throughout the entirety of the grant period.

*Overview of Preliminary Findings for Cohorts 1, 2, 3, 4, 5, 6, and 7: Performance Measure 8b*
When we turn to the second performance measure (8b) of this objective, we find baseline data collection for each cohort began with the CSUN student recruitment/applicant process.  This process began in late Fall 2011/early Spring 2012 for Cohort 1, late Spring 2012/early Fall 2012 for Cohort 2, late Spring 2013/early Fall 2013 for Cohort 3, late Fall 2013/early Spring 2014 for Cohort 4, late Summer 2014/early Fall 2014 for Cohort 5, late Summer 2015/early Fall 2015 for Cohort 6, and late Fall 2016/early Spring 2017 for Cohort 7.  With recruitment questionnaires, we asked cohort participant applicants the number of academic advising sessions that they had received immediately prior to the formation of Cohort 1 in Spring 2012, Cohort 2 in Fall 2012, Cohort 3 in Fall 2013, Cohort 4 in Spring 2014, Cohort 5 in Fall 2014, Cohort 6 in Fall 2015, and Cohort 7 in Fall 2016.

*Preliminary Findings for Cohort 1 in Project Years 1 and 2: Performance Measure 8b*
After aggregating the results, the number of academic advising sessions that CSUN cohort participants reported prior to project entry is 56 (CSUN students only), which represents the baseline figure for this measure.  Given the project target of increasing the number of academic advising sessions by two sessions per student, the current

target number of sessions for the project is 116. We derived this target by multiplying the number of unduplicated student headcount of Cohort 1 participants at CSUN (n=30) by two (sessions per student) and adding 56 sessions to the total for a total of 116. Further, actual performance data for the second performance measure (8b)—collected through cohort participant journaling during the first performance period—reveals that cohort participants reported 90 total academic advising sessions through the end of the first performance period. This figure (n=90) represents 78% of the total project target (n=116) and demonstrates substantial progress toward the project target of 116 total academic advising sessions. Additionally, actual performance data collected through the second performance period reveals that cohort participants reported 95 total academic advising sessions through the end of the second performance period. This figure (n=95) represents 82% of the total project target (n=116). This figure (n=95) represents an increase of five more advising sessions reported from the total number of academic advising sessions (n=90) for the performance period of the first project year, but does not exceed the total project target (=116).

*Preliminary Findings for Cohort 3 in Project Years 3 and 4: Performance Measure 8b*
The number of academic advising sessions that CSUN Cohort 3 participants reported prior to project entry is 5 (CSUN students only), which represents the baseline figure for this measure. Given the project target of increasing the number of academic advising sessions by two sessions per student (n=9), the current target number of sessions for Cohort 3 is 23. We derived this target by multiplying the number of unduplicated Cohort 3 participants at CSUN (n=9) by two (sessions per student) and adding 5 sessions to the total for a total of 23. By contrast, actual performance data for the second performance measure (8b) shows that Cohort 3 participants reported 74 total academic advising sessions through the end of year 3, their first performance period. This figure (n=74) exceeds the total project target (n=23) for the performance measure in the performance period and demonstrates a strong commitment to academic advising with cohort participants. Conversely, actual performance data for year 4, their second performance period, shows that Cohort 3 participants reported 21 total academic advising sessions. This figure (n=21) represents a decrease of 53 fewer advising sessions reported from the total number of academic advising sessions (n=74) for the performance period of the third project year and does not exceed the total project target (n=23) for the performance period (i.e., fourth project year). We note that students in Cohort 3 may not have demonstrated a level of participation in academic advising sufficient to meet or exceed the target because they were moving toward senior standing.

*Preliminary Findings for Cohort 5 in Project Years 5 and 6: Performance Measure 8b*
The number of academic advising sessions that CSUN Cohort 5 participants reported prior to project entry is 7 (CSUN students only), which represents the baseline figure for this measure. Given the project target of increasing the number of academic advising sessions by two sessions per student (n=9), the current target number of sessions for Cohort 5 is 25. We derived this target by multiplying the number of unduplicated Cohort 5 participants at CSUN (n=9) by two (sessions per student) and adding 7 sessions to the total for a total of 25. Further, actual performance data for the second performance measure (8b)—collected through cohort participant journaling during the performance period—reveals that Cohort 5 participants reported 12 total academic advising sessions in year 5, their first performance period, and 4 total academic advising sessions through the end of current and final performance period, year 6. The figure in the sixth performance period (n=4) represents a decrease of 8 fewer advising sessions reported from the total number of academic advising sessions (n=12) for the performance period of the fifth project year. And the actual performance data totals do not exceed the total project target (n=25) for the performance measure in the either performance period (i.e., fifth and sixth project years). We note that students in Cohort 5 did not have a high response rate in the monthly journal submissions. Furthermore, they may not have demonstrated a level of participation in academic advising in the final performance period sufficient to meet or exceed the target because they were moving toward graduation, with six (6) of the nine (n=9) cohort participants graduating in Summer 2017.

*Preliminary Findings for Cohort 6 in Project Years 5 and 6: Performance Measure 8b*
Meanwhile, the number of academic advising sessions that CSUN Cohort 6 participants reported prior to project entry is 4 (CSUN students only), which represents the baseline figure for this measure. Given the project target of increasing the number of academic advising sessions by two sessions per student (n=6), the current target number of sessions for Cohort 6 is 16. We derived this target by multiplying the number of unduplicated Cohort 6 participants at CSUN (n=6) by two (sessions per student) and adding 4 sessions to the total for a total of 16. By contrast, actual performance data for the second performance measure (8b) shows that Cohort 6 participants reported 10 total academic advising sessions in both the fifth and sixth performance periods. The figure (n=10) for both performance periods (i.e., fifth and sixth project years) does not exceed the project target of 16 total academic advising sessions.

*Preliminary Findings for Cohort 7 in Project Year 6: Performance Measure 8b*
Meanwhile, the number of academic advising sessions that CSUN Cohort 7 participants reported prior to project entry is 24 (CSUN students only), which represents the baseline figure for this measure. Given the project target of increasing the number of academic advising sessions by two sessions per student (n=27), the current target number of sessions for Cohort 7 is 78. We derived this target by multiplying the number of unduplicated Cohort 7 participants at CSUN (n=27) by two (sessions per

student) and adding 24 sessions to the total for a total of 78.  Further, actual performance data for the second performance measure (8b) shows that Cohort 7 participants reported 85 total academic advising sessions through the end of performance period.  The figure (n=85) for this performance period exceeds the project target of 78 total academic advising sessions.

*Preliminary Findings for All Cohorts Throughout the Grant*
Each cohort demonstrated a strong commitment to academic advising with cohort participation in their first year, and followed with a decline in academic advising sessions recorded in their respective second years (with the exception of Cohort 1, which experienced an increase in academic advising sessions recorded in their second year).  We note that across each cohort there was not a high response rate in the monthly journal submissions in the second year of each cohort.  They may not have demonstrated a level of participation in academic advising because they were moving toward senior-standing.  Across six years and seven cohorts, the total target of academic advising sessions was 715. When considering the actual performance measure data for this objective overall, we see that 711 discrete academic advising sessions took place. Considering the pattern of a drop off in monthly journal response rates as cohort students entered their senior year and neared their completion data, this figure demonstrates substantial progress towards increasing the number of advising/counseling sessions with students.

## Description of Project Activities Related to the Objective
Project activities that supported the two performance measures for this objective included faculty mentoring through cohort and individual student meetings, career advising through cohort meetings with faculty mentors, academic advising in the student services center, and academic workshops.  In addition, more informal advising occurred at events like AIMS$^2$ orientations—which occurred on 11/15/12 for Cohort 2, 8/23/13 for Cohort 3, 2/21/14 for Cohort 4, and 9/19/14 for Cohort 5—and AIMS$^2$ workshops.  To support academic and career advising, we disseminated information through posts of upcoming workshops, internships, and events on our project's website (http://www.ecs.csun.edu/aims2/).  In addition, with the distribution of iPads to most cohort participants (in Cohorts 1, 2, 3, 4, and 5), we hoped to support student access to academic and career advising tools available online and via email exchanges with project faculty and staff and apps.

## Plans to Use of Performance Data to Monitor Progress
With actual performance measure data for both measures in this project objective for this period, we have reported baseline and actual performance measure in this report.

**Note that in the ratio columns of the target and actual performance data "the numerator represents the numerical target (e.g., the number of students that are expected to attain proficiency) or actual performance data (e.g., the number of students that attained proficiency), and the denominator represents the universe (e.g., all students served)" (Instructions for Grant Performance Report, p. 7).

***Baseline data per Instructions for Grant Performance Report; baseline data collected by cohort/cohort entry year

****Cohort 4 experienced a decrease in student participants due to institutional departure and program completion. Given this greater-than-average decline, we removed these student records from cohort performance measure calculations and updated baseline data for Year 5.

Explanation of Progress (Include Qualitative Data and Data Collection Information)

**Evaluation Data Sources and Methods for the Objective**
**With respect to baseline data for these three performance measures of this objective, data collection began with the cohort recruitment cycles in early Spring 2012 (Cohort 1), early Fall 2012 (Cohort 2), early Fall 2013 (Cohort 3), early Spring 2014 (Cohort 4), early Fall 2014 (Cohort 5), early Fall 2015 (Cohort 6), and early Fall 2016 (Cohort 7). During the interview and/or questionnaire administration process, we asked cohort applicants for all cohorts the number of tutoring sessions, academic workshops, and supplemental lab sessions in which they had participated prior to program entry.**

**Description of Preliminary Findings Related to the Objective**
**Below we report actual performance data for all three measures for Cohorts 1, 3, 5, 6, and 7.**

*Preliminary Findings for Cohort 1 in Project Years 1 and 2: Performance Measures 9a, 9b, and 9c*
**During the performance period, baseline data for the three performance measures of this objective reveal that the number of Cohort 1 students who reported having participated in tutoring sessions is 15 students, while the total number of Cohort 1 students who reported having participated in an academic workshop is six students. Further, only one Cohort 1 student had reported participating in supplemental lab sessions prior to project entry (i.e., in Fall 2011) during the recruitment interview process. These three figures relate to the number of students (i.e., headcount) rather than sessions or workshops. Accordingly, these three figures represent Cohort 1 baseline data for these three measures, respectively. Given the baseline data, the current project targets—all of which represent a 75% increase—for the three measures are 26 students (9a), 11 students (9b), and 2 students (9c).**

**In contrast, actual performance data for performance measure 9a for Cohort 1, collected through structured journaling, reveal that in project year 1, 23 students reported participating in tutoring sessions. As a performance measure that requires us to collect headcount data rather than frequency data, this figure demonstrates substantial progress toward the project target for student participation in tutoring sessions and represents 77% (23/30) of all Cohort 1 participants. In fact, actual performance data for this performance measure indicate that the number of students who participated in tutoring (n=23) in project year 1 approached the target (n=26). Additionally, data collected in project year 2 reveal that 22 students reported participating in tutoring sessions. These data represent 70% (21/30) of all Cohort 1 participants—a decline in one headcount (n=23) from the performance period of the first project year. The actual performance data for this performance measure indicate that the number of students who participated in tutoring (n=21) in project year 2 approached the target (n=26). With Cohort 1 students graduating or nearing graduation in project year 2, we speculate that fewer students require tutoring support as they assume senior standing and near program completion.**

**With respect to performance measure 9b, 15 students reported participating in academic workshops through the first performance period, which represents 25% (15/30) of Cohort 1 participants and indicates that actual performance data (n=15) exceeded the project target (n=11) and progress toward the project objective has been achieved for this performance measure in project year 1. With respect to actual data in project year 2, 11 students from Cohort 1— a decline compared to the 2012-13 (first) performance period figure (n=15)—reported participating in academic workshops through the second performance period. This figure (n=11) represents 37% (11/30) of Cohort 1 participants and indicates that actual performance data (n=11) met the project target (n=11) and the project objective has been achieved for this performance measure in project year 2.**

**Finally, with respect to performance measure 9c, nine Cohort 1 students reported participating in a supplemental lab in project year 1. Accordingly, actual data indicate that performance in this area of the objective (i.e., 30% of all Cohort 1 participants) exceeded the project target (n=2), suggesting that this project performance measure 9c has been achieved during the first performance period. Furthermore, in project year 2, 10 Cohort 1 students reported participating in a supplemental lab. Accordingly, actual data indicate that performance in this area of the objective (i.e., 33% of all Cohort 1 participants) surpassed the actual performance data (n=9) from the first project year and exceeded the project target (n=2), suggesting that this project performance measure 9c has been achieved during the second performance period.**

**Taken together, actual performance data on these three measures demonstrate substantial progress in meeting (performance measure 9a) or evidence of achieving (performance measures 9b and 9c) this project objective related to increasing student participation by 75% in tutoring, academic workshops, and supplemental labs.**

*Preliminary Findings for Cohort 3 in Project Years 3 and 4: Performance Measures 9a, 9b, and 9c*
**During the performance period, baseline data for the three performance measures of this objective reveal that 5 students reported having participated in tutoring sessions in Cohort 3, while a total of three students reported having participated in an academic workshop prior to program entry. Furthermore, three students from Cohort 3 had reported participating in supplemental lab sessions prior to project entry (i.e., in Fall 2013) during the baseline data collection process. These three figures relate to the number of students (i.e., headcount) rather than sessions or workshops. Accordingly, these three figures represent Cohort 3 baseline data for these three measures. Given the baseline data, the Cohort 3 project targets—all of which represent a 75% increase—for the three measures include 9 students (9a), 5 students (9b), and 5 students (9c).**

**In contrast, actual performance data for the three measures for Cohort 3, collected through structured journaling, reveal that 7 students reported participating in tutoring sessions (performance measure 9a). As a performance measure that requires us to collect headcount data rather than frequency data, these data demonstrate substantial progress toward the project target for student participation in tutoring sessions and represents 78% (7/9) of all Cohort 3 participants. The actual performance data for this performance measure indicate that the number of students who participated in tutoring (n=7) approached the target (n=9). Similarly, actual performance data collected in project year 4 reveal that 5 students reported participating in tutoring sessions. These data represent 56% (5/9) of all Cohort 3 participants. While the headcount declined compared to the third performance period figure (n=7), the actual performance data for this performance measure indicate that the number of students who participated in tutoring (n=5) in project year 4 was maintained in relation to the target (n=9). When we examine tutoring participation across both project years (project years 3 and 4) by major, we find that students across most majors participated in tutoring. As we see in the table below, computer science (n=2), computer information systems (n=2), electrical engineering (n=6), and mechanical engineering (n=2) each recorded student by headcount who participated in tutoring.**

**Peer Tutoring Participation by Major and Cohort, AIMS[2] Cohort Participants, Cohort 3, October 2013-September 2015**

| Major<br>Cohort 3<br>Project Year | *Civil Engineering and Construction Management* | *Computer Science* | *Computer Information Systems* | *Electrical Engineering* | *Manufacturing Systems Engineering* | *Mechanical Engineering* | **TOTAL** |
|---|---|---|---|---|---|---|---|
| Project Year 3 | 0 | **1** | **1** | **4** | 0 | **1** | **7** |
| Project Year 4 | 0 | **1** | **1** | **2** | 0 | **1** | **5** |
| **TOTAL** | 0 | **2** | **2** | **6** | 0 | **2** | **12** |

**With respect to performance measure 9b in project year 3, 6 students from Cohort 3 reported participating in academic workshops through the period, which represents 67% (6/9) of Cohort 3 participants. This indicates that actual performance data (n=6) exceeded the project target (n=5) and the project objective has been achieved for this performance measure in project year 3. Additionally, in project year 4, 2 students from Cohort 3 reported participating in academic workshops through the period. These data represent 22% (2/9) of all Cohort 3 participants—a decline in four headcounts (n=6) from the performance period of the third project year—and indicates that actual performance data (n=2) did not exceed the project target (n=5).**

**Finally, with respect to performance measure 9c in project year 3, 4 students (Cohort 3) reported participating in a supplemental lab. Accordingly, actual data indicate that performance in this area of the objective (i.e., 44% of all Cohort 3 participants) fell short of the project target (n=5). Likewise, in project year 4, 4 students from Cohort 3—a constant compared to the third performance period figure (n=4)—reported participating in a supplemental lab. Accordingly, actual data indicate that performance in this area of the objective (i.e., 44% of all Cohort 3 participants) fell just short of the project target (n=5).**

**Taken together, actual performance data on these three measures demonstrate substantive progress toward meeting (but not actually meeting) this project objective related to increasing student participation by 75% in tutoring, academic workshops, and supplemental labs for Cohort 3.**

*Preliminary Findings for Cohort 5 in Project Years 5 and 6: Performance Measures 9a, 9b, and 9c*
**During the performance period, baseline data for the three performance measures of this objective reveal that the number of Cohort 5 students who reported—prior to program entry—having participated in tutoring sessions is 6, the total number of Cohort 5 students who reported having participated in an academic workshop is 5, and**

the total number of Cohort 5 students who reported participating in supplemental lab sessions is 2.  These three figures relate to the actual number of Cohort 5 students (i.e., headcount) rather than sessions or workshops.  As such, these figures represent Cohort 5 baseline data for these three measures, respectively.  With these baseline data, the project targets—all of which represent a 75% increase—for Cohort 5 for the three measures are 9 students (9a), 9 students (9b), and 4 students (9c).

When we turn to actual performance data for Cohort 5 in project year 5, we discover that 1 student reported participating in tutoring sessions (performance measure 9a).  As a headcount measure, this figure represents 11% (1/9) of all Cohort 5 participants.  That is, actual data for this performance measure indicate that the number of students who participated in tutoring (n=1) did not exceed the target (n=9).  Additionally, data collected in project year 6 reveal that 0 students reported participating in tutoring sessions.  These data represent 0% (0/9) of all Cohort 5 participants—a decline in one headcount (n=1) from the performance period of the fifth project year—and indicate that the number of students who participated in tutoring (n=0) did not exceed the target (n=9).

For performance measure 9b, in project year 5, 4 students reported participating in academic workshops through the period, which represents 44% (4/9) of Cohort 5 participants and suggests that the number of students who participated in academic workshops (n=4) was maintained in relation to the baseline (n=5).  With respect to actual data in project year 6, 1 student from Cohort 5— a decline compared to the fifth performance period figure (n=4)—reported participating in academic workshops through the sixth performance period.  This represents 11% (1/9) of Cohort 5 participants.

Finally, with respect to performance measure 9c in project year 5, 3 students reported participating in a supplemental lab, which points to actual data (i.e., 33% of all Cohort 5 participants) that demonstrates progress on this project performance measure (9c) during the period.  Similarly, actual performance data collected in project year 6 reveal that 1 student reported participating in a supplemental lab through the period.  This represents 11% (1/9) of the Cohort 5 participants and a decline in two headcounts (n=3) from the performance period of the fifth project year.

Taken together, actual performance data on these three measures demonstrate continued progress toward meeting (but not meeting) this project objective related to increasing student participation in three key academic activities: tutoring, academic workshops, and supplemental labs.  We note that students in Cohort 5 did not have a high response rate in the monthly journal submissions during the sixth and final project year.  Furthermore, they may not have demonstrated a level of participation in the three activities that relate to this object sufficient to meet or exceed the target because they were moving toward graduation, with six of nine (6/9) cohort participants graduating in Summer 2017.

*Preliminary Findings for Cohort 6 in Project Years 5 and 6: Performance Measures 9a, 9b, and 9c*
During the performance period, baseline data for the three performance measures of this objective reveal that 3 students reported having participated in tutoring sessions in Cohort 6, while a total of 3 students reported having participated in an academic workshop prior to program entry.  Furthermore, 1 student from Cohort 6 had reported participating in supplemental lab sessions prior to project entry (i.e., in Fall 2016) during the baseline data collection process.  These three figures relate to the number of students (i.e., headcount) rather than sessions or workshops.  Accordingly, these three figures represent Cohort 6 baseline data for these three measures.  Given the baseline data, the Cohort 6 project targets—all of which represent a 75% increase—for the three measures include 5 students (9a), 5 students (9b), and 2 students (9c).

When we turn to actual Cohort 6 performance data for performance measure 9a in project year 5, collected through monthly structured journaling, we discover that 4 students reported participating in tutoring sessions.  As a headcount measure, this figure represents 67% (4/6) of all Cohort 6 participants.  That is, actual data for this performance measure indicate that the number of students who participated in tutoring (n=4) approached the target (n=5).  In contrast, actual performance data collected in project year 6 reveal that 1 student reported participating in tutoring sessions.  These data represent a decrease from the previous performance period (n=4), and 17% (1/6) of all Cohort 6 participants.  The actual performance data for this performance measure indicate that the number of students who participated in tutoring (n=1) in project year 6 did not exceed the project target (n=5).

With respect to performance measure 9b in project year 5, 1 student from Cohort 6 reported participating in academic workshops through the fifth performance period, which represents 17% (1/6) of Cohort 6 participants.  This indicates that actual performance data (n=1) did not meet the project target (n=5) and the project objective

has been achieved for this performance measure in project year 5. Similarly, actual performance data collected in project year 6 reveal that 1 student reported participating in tutoring sessions. These data represent 17% (1/6) of all Cohort 6 participants. While the headcount was maintained, the actual performance data for this performance measure indicate that the number of students who participated in tutoring (n=1) in project year 6 did not meet the target (n=5).

Finally, with respect to performance measure 9c, 2 Cohort 6 students reported participating in a supplemental lab in project year 5. Accordingly, actual data indicate that performance in this area of the objective (i.e., 33% of all Cohort 6 participants) met the project target (n=2), suggesting that this project performance measure 9c has been achieved during the fifth performance period. Conversely, in project year 6, 0 students reported participating in a supplemental lab. Accordingly, actual data indicate that performance in this area of the objective (i.e., 0% of all Cohort 6 participants) fell short of the project target (n=2).

Taken together, actual performance data on these three measures demonstrate substantive progress toward meeting (but not actually meeting, with the exception of performance measure 9c in project year 5) this project objective related to increasing student participation by 75% in tutoring, academic workshops, and supplemental labs for Cohort 6. We note that students in Cohort 6 did not have a high response rate in the monthly journal submissions.

*Preliminary Findings for Cohort 7 in Project Year 6: Performance Measures 9a, 9b, and 9c*
During the performance period, baseline data for the three performance measures of this objective reveal that 6 students reported having participated in tutoring sessions in Cohort 7, while a total of 4 students reported having participated in an academic workshop prior to program entry. Furthermore, 3 students from Cohort 7 had reported participating in supplemental lab sessions prior to project entry (i.e., in Fall 2016) during the baseline data collection process. These three figures relate to the number of students (i.e., headcount) rather than sessions or workshops. Accordingly, these three figures represent Cohort 7 baseline data for these three measures. Given the baseline data, the Cohort 7 project targets—all of which represent a 75% increase—for the three measures include 11 students (9a), 7 students (9b), and 5 students (9c). In contrast, actual performance data for the three measures for Cohort 7, collected through monthly structured journaling, reveal that 10 students reported participating in tutoring sessions (performance measure 9a). As a performance measure that requires us to collect headcount data rather than frequency data, these data represent 37% (10/27) of all Cohort 7 participants. The actual performance data for this performance measure indicate that the number of students who participated in tutoring (n=10) did not exceed the project target (n=11). When we examine tutoring participation in Cohorts 5, 6, and 7 by major, we find that students across several majors participated in tutoring. As we see in the table below, civil engineering and construction management (n=1), computer science (n=2), electrical engineering (n=5), manufacturing systems engineering (n=1), and mechanical engineering (n=2) each recorded student by headcount who participated in tutoring. Finally, more students from Cohort 7 participated in tutoring (0 in Cohort 5 vs. 1 in Cohort 6 vs. 10 in Cohort 7) during the performance period.

**Peer Tutoring Participation by Major and Cohort, AIMS[2] Cohort Participants, Cohorts 5, 6, and 7, October 2016-September 2017**

| *Major*<br><br>*Cohort* | *Civil Engineering and Construction Management* | *Computer Science* | *Computer Information Systems* | *Electrical Engineering* | *Manufacturing Systems Engineering* | *Mechanical Engineering* | **TOTAL** |
|---|---|---|---|---|---|---|---|
| Cohort 5 | 0 | 0 | 0 | 0 | 0 | 0 | **0** |
| Cohort 6 | 0 | 0 | 0 | 1 | 0 | 0 | **1** |
| Cohort 7 | 1 | 2 | 0 | 4 | 1 | 2 | **10** |
| **TOTAL** | **1** | **2** | **0** | **5** | **1** | **2** | **11** |

For performance measure 9b, 9 students from Cohort 7 reported participating in academic workshops through the period, which represents 33% (9/27) of Cohort 7 participants and indicates that actual performance data (n=9) did exceed the project target (n=7). Finally, with respect to performance measure 9c, 7 students (Cohort 7) reported participating in a supplemental lab. Accordingly, actual data indicate that performance in this area of the objective (i.e., 26% of all Cohort 7 participants) exceeded the project target (n=5). Taken together, actual performance data on these three measures demonstrate substantive and mixed progress toward meeting these project objectives. Taken together, actual performance data on these three measures demonstrate substantial progress towards meeting (performance measure 9a) or evidence of achieving (performance measures 9b and 9c) this project objective related to increasing student participation by 75% in tutoring, academic workshops, and supplemental labs.

*Preliminary Findings for All Cohorts Throughout the Grant*

Each cohort demonstrated a strong commitment to tutoring, academic workshops, and supplemental labs with cohort participation in their first year, and followed with a decline in tutoring, academic workshops, and supplemental lab sessions recorded in their respective second years (with the exception of Cohort 1 in performance measure 9c). We note that across each cohort there was not a high response rate in the monthly journal submissions in the second year of each cohort. They may not have demonstrated a level of participation in these areas because they were moving toward senior-standing. Considering the pattern of a drop off in monthly journal response rates as cohort students entered their senior year and neared their completion data, these data demonstrate substantial progress towards increasing the number of tutoring, academic workshops, and supplemental lab sessions with students.

**Description of Project Activities Related to the Objective**
With respect to the first performance measure (9a), beginning in February-March 2012 with Cohort 1 and continuing through all performance periods, with the formation of Cohort 2 in August 2012, Cohort 3 in August 2013, Cohort 4 in February 2014, Cohort 5 in August 2014, Cohort 6 in August 2015, and Cohort 7 in August 2016, we have continued to recruit, hire, train, and assign classes to peer tutors from CSUN to work with cohort participants. In addition, we developed a model to recruit, hire, train, and assign peer tutors within faculty mentor groups to facilitate closer ties between faculty mentors, peer tutors, and cohort participants. As part of the process, project faculty and staff coordinated a process to advertise, recruit, hire, and train peer tutors from CSUN's upper-division undergraduate and graduate students in the College of Engineering and Computer Science at the department or discipline level—within the respective faculty mentor groups. Similarly, faculty mentors have continued to work with project staff to identify the "bottleneck" and/or "gateway" courses where tutoring may be needed for cohort participants. Also as part of the process, we produced a complete tutoring list with names and contact information of tutors to distribute and disseminate to cohort participants (see: http://www.ecs.csun.edu/aims2/peer_tutors.html). With these strategies, we seemed to have supported cohort participant use of tutoring/peer tutoring. In addition to these activities related to tutoring (i.e., performance measure 9a), the second performance measure (9b) guides our work with workshops, where we post and disseminate information on upcoming workshops on our project's website (http://www.ecs.csun.edu/aims2/). Finally, faculty mentors have maintained small group sessions with cohort participants in their instructional labs (to support performance measure 9c). To support student participation in supplemental labs (performance measure 9c), we adopted technology resources during the first three years of the project. Over the second, third, fourth, and fifth years of the project, we added Apple tablets to the cohort experience with dissemination of iPads to students and faculty in the project to support workshops and supplemental lab participation.

**Plans to Use of Performance Data to Monitor Progress**
Data collection to measure actual performance on these three performance measures for this objective consisted of survey data collection (e.g., cohort journaling), which occurred through student completion of an electronic journal form with items related to project outcomes. Specifically, we asked students to indicate the number of sessions or workshops that they attended in the past month, including the number of supplemental lab sessions, the number of academic advising sessions, and the number of academic workshops. As part of the journaling process, students completed and submitted an electronic journal entry by the end of every month. Once submitted, data extracts in Excel occurred, after which a tabulation of the aggregate numbers were performed.

Explanation of Progress (Include Qualitative Data and Data Collection Information)

**Evaluation Data Sources and Methods for the Objective**

*Quantitative Data Sources and Data Collection Procedures for Performance Measure 10a*

For each of the seven (7) cohorts, baseline data collection for this performance measure (10a) occurred via cohort questionnaire administration.  During the baseline data collection process for all cohorts, we asked cohort applicants for the number of faculty research-related sessions that they had in their respective terms, which were the Summer/Fall 2011 term (prior to program entry for Cohort 1), Spring/Summer 2012 term (prior to program entry to Cohort 2), Spring/Summer 2013 term (prior to program entry to Cohort 3), Summer/Fall 2013 term (prior to program entry for Cohort 4), Spring/Summer 2014 term (prior to program entry for Cohort 5), Spring/Summer 2015 term (prior to program entry to Cohort 6), and the Spring/Summer 2016 term (prior to program entry to Cohort 7).  We found that in project year one, no (n=0) student participated in a faculty research session prior to entry into the project.  Give the project target for the first performance measure (10a) was an increase of over 50% of the baseline figure, the actual project target for Cohort 1 was 1/30 (3%).  In project year three, we found that Cohort 2 students (n=0) had not participated in a faculty research session prior to entry into the project, while a third of Cohort 3 students (n=3) had participated in faculty research.  Considering the project target increase of over 50% of the baseline figure, the actual project target for Cohort 2 was 1/29 (3%)and for Cohort 3 is 6/9 (67%). In the final project year six, we found that one third of Cohort 5 students (n=3) had participated in faculty research prior to entry into the project, less than twenty percent of Cohort 6 students (n=1) had participated in a faculty research session, and less than ten percent of Cohort 7 students (n=2) had participated in a faculty research session prior to entry into the project.  Given the Cohorts 5, 6, and 7 project target for the first performance measure was an increase of over 50% of the baseline figure, the actual project target for Cohort 5 is 5/9, Cohort 6 is 2/6, and Cohort 7 is 3/27.  Data collection to measure actual performance on these two performance measures consists of a combination of document data and survey/questionnaire data collection (e.g., structured journaling), which occurs through student completion of a web-based journal form with items related to project objectives.  Specifically, we included items to assess performance on measure 10a of this objective where we ask students to indicate the number of faculty research sessions that they attended in the past month.  Once submitted, we extracted data from journal entries into Excel, after which we tabulated the aggre-gate number of research-related sessions with faculty.  *Note that these data sources for performance measure 10a (e.g., student self-reports in structured journals) differ from data sources for participation in summer faculty research reported below.  For the latter, faculty mentors reported student participants in summer research.*

*Interview Data Sources and Sample for Performance Measure 10b*

In evaluating performance measure 10b, we analyzed a subsample of 24 interviews, all of which were conducted during Summer 2014 and early Fall 2014. Participants from the total sample were selected using a mixed sampling strategy of criterion and stratified purposeful sampling. Specifically, we used a criterion sample to select participants who met specific criteria for inclusion in the AIMS[2] program. These criteria include: a declared STEM major enrolled full-time in a CECS program; inclu-sion in a group that is economically, educationally, and environmentally disadvantaged or identification as Hispanic; and student transfer status. Additional criteria for inclusion in the interviews match AIMS[2] participation requirements, including the following: (a) pass all courses enrolled in each semester, (b) continue to be a declared STEM major, (c) enroll in a minimum of 12 units each semester, (d) earn a grade of "C+" or better in each class enrolled, and (e) participate in components of the pro-gram. In addition to the criterion strategy described above, we used stratified purposeful sampling in order to achieve a diverse sample. As such, we solicited interview participation from Cohorts 1, 2, 3 and 4 in Summer 2014 with a stratification based on gender, ethnicity, and program major. That is, we reviewed the full roster of AIMS[2] students in all cohorts and purposefully attempted to build a sample of students in specific strata. The goal of this sampling strategy was to create diverse groups by major, gender, and ethnicity. The sample of 24 interviews used to evaluate performance measure 10b reflects this diversity of the cohorts.  With respect of student demographic characteristics, 19 interviewees identified as men and 5 as women, while 13 interviewees identified as Hispanic or Latino, 4 as Middle Eastern, 4 as White, 1 as Asian or Asian American, 1 as other, and 1 declined to state.  As far as majors in engineering and computer science fields, 8 interviewees reported their major as mechanical engineering: 7 as computer science and computer information technology, 5 as electrical and computer engineering, 3 as civil engineering and construction management, and 1 as manufacturing systems engineering.

*Interview Data Collection Instruments and Procedures for Performance Measure 10b*

The primary instrument that we used to collect data from the 24 participants was an interview protocol. Overall, the interview protocol served to gather information from cohort participants related to validation and college-going capital in domains of family background, peer-peer interaction, student-faculty interaction, and academic and career preparation. For example, we asked the participants to respond to the following questions: What did you expect CSUN to be like when you first got here? Do you feel like you had the right experiences in your upbringing to prepare yourself for college? Do you feel like you need to have a certain background to be in your major? Have there been any situations where someone has taken an active interest in you, or thought you were capable of doing something, to get you more involved in your education? Using the interview protocol, we conducted one-on-one, 60-minute personal interviews with students from Cohorts 1, 2, 3, and 4, whom we invited to participate in the interviews through email. Once we received their response, we set times and dates for the interviews when both the particular student and one of the researchers could meet. The Dean's office arranged a secure, quiet room available for the interviews, which we conducted during Summer/early Fall 2014. To maintain and store confidential interview information, we assigned each cohort participant a three-digit random number. During the interview session, we shared an informed consent form with participants and audio recorded the session. Upon completion of the interviews, we transcribed the audio files into a de-identified data file. The recorded audio files were subsequently destroyed. We stored the transcribed files on a password-protected, secure laptop

*Interview Data Analysis Procedures for Performance Measure 10b*
After transcription, we proceeded with coding and thematic data analysis using ATLAS.ti, a computer-aided qualitative data analysis software program. Specifically, we used the themes that emerged from the ATLAS.ti analysis and from codes developed in hard copy transcribed data files. We then categorized the themes that emerged from codes that we clustered according to experiences and interactions of the cohort participants. These categories were used to align thematic findings to the performance measures associated with program objectives. Finally, we extracted direct quotes taken from the interviewees to illustrate themes and support overall findings.

**Description of Preliminary Findings Related to the Objective**
With student journaling in Cohorts 1, 2, 3, 4, 5, 6, and 7 and student interviews with Cohorts 1, 2, 3, and 4, we report actual performance data for both measures for the first, third, and sixth project year. In addition to the procedures described above, student interviews are used here to assess the second performance measure (10b). For this performance period, we used these two procedures to support a mixed-methods approach with the collection of both quantitative and qualitative data.

*Preliminary Findings for Cohort 1 in Project Year 1: Performance Measure 10a*
Actual performance data for this first measure indicate that we have achieved this part of this objective. In fact, during the first performance period, over half of Cohort 1 student (n=16) participated in faculty research, which represents 53% of all Cohort 1 participants and a dramatic increase over the baseline figure (n=0). As a result, actual performance data related to this performance measure (10a) of this objective demonstrate that we have exceeded the project target (n=1) and achieved this part of this objective.

*Preliminary Findings for Cohorts 2 and 3 in Project Year 3: Performance Measure 10a*
For Cohort 2, actual performance data for this first measure indicate that we have partially achieved this part of this objective. In fact, during the third performance period, 9 participants from Cohort 2 reported engagement in faculty research, which represents 31% of Cohort 2. From Cohort 3 participants, 5 students reported involvement in faculty research, a figure which represents 56% (5/9) of all Cohort 3 participants. As a result, actual performance data related to this performance measure (10a) of this objective demonstrate that we have exceeded the project target (n=1) for Cohort 2 and made substantive progress toward the target for Cohort 3. We suspect that the reason that we did not meet the project target for Cohort 3 during this performance period relates to the status of Cohort 3 students as AIMS[2] cohort participants at Glendale Community College and College of the Canyons, where they had opportunities to participate in faculty research with their respective college faculty and CSUN faculty mentors.

*Preliminary Findings for Cohorts 5, 6, and 7 in Project Year 6: Performance Measure 10a*
For Cohort 5, actual performance data for this first measure (10a) indicate that we have not achieved this part of this objective. In fact, during the final performance period, 1 participant from Cohort 5 reported engagement in faculty research, which represents 11% (1/9) of Cohort 5. For Cohorts 6 and 7, actual performance data for this first measure (10a) indicate that we have achieved this part of the objective. From Cohort 6 participants, 3 students reported involvement in faculty research, a figure which represents 50% (3/6) of all Cohort 6 participants. And from Cohort 7 participants, 13 students reported involvement in faculty research, a figure which represents 48% (13/27) of all Cohort 7 participants. As a result, actual performance data related to this performance measure (10a) of this objective demonstrate that we have maintained sustained progress toward the project target (n=5) for Cohort 5 and exceeded the Cohort 6 target (n=2) as well as the Cohort 7 (n=3) project target.

We suspect that the reason that we did not meet the project target for Cohort 5 during this performance period relates to the status of Cohort 5 students as AIMS$^2$ cohort participants at Glendale Community College and College of the Canyons, where they had opportunities to participate in faculty research with their respective college faculty and CSUN faculty mentors. Additionally, Cohort 5 students may not have demonstrated a level of participation in research related activities because they were moving toward graduation, with over half (6/9 or 67%) of the cohort participants graduating in Summer 2017.

*Preliminary Findings for All Cohorts Throughout the Grant*
When considering the overall grant project period, a total of 176 students across 64 separate or discrete research projects were provided the opportunity to interact with CSUN faculty, CSUN students, and COC/GCC students through their participation. And of those 176 participating students, there were 28 students from COC and 36 students from GCC.

**Summer Research Participants Throughout the Grant Period**

| Year | COC | GCC | Mission | Moorpark | Pierce | Valley | CSUN | Total |
|------|-----|-----|---------|----------|--------|--------|------|-------|
| 1 | 3 | 4 | -- | -- | -- | -- | 8 | 15 |
| 2 | 2 | 8 | 1 | -- | -- | -- | 15 | 26 |
| 3 | 7 | 4 | 2 | -- | -- | -- | 16 | 29 |
| 4 | 3 | 7 | -- | -- | -- | -- | 23 | 33 |
| 5 | 4 | 8 | 4 | 9 | 5 | -- | 6 | 36 |
| 6 | 9 | 5 | -- | 3 | 9 | 1 | 10 | 37 |
| Total | 28 | 36 | 7 | 12 | 14 | 1 | 78 | 176 |

As noted in the table above, the total number of students participating in summer research projects increased each year. Also, the number of CSUN student participants became equalized with the number of student participants at each community college institution. In year 1, CSUN students comprised 53% (8/15) of the total research participants; and in year 3, CSUN students comprised 57% (16/29) of the total research participants. Yet by year 6, CSUN students made up only 27% (10/37) of the total research participants, with the remaining students coming from the five other community college institutions (COC, GCC, Moorpark, Pierce, and Valley).

*Preliminary Findings for Cohorts 1, 2, 3, and 4 in Project Year 4: Performance Measure 10b*
Over the past years, AIMS$^2$ students have participated in a variety of faculty research projects. In evaluating the second performance measure (10b), which relates to the improvement of research skills and interests, we learned that participants had worked on rechargeable metal-ion batteries, camera drones, web portal applications, construction cost estimating, elementary level STEM classroom activities, cultivating an entrepreneurial mindset, and robotics. For these students, research experiences have facilitated overall beneficial interaction with faculty. Indeed, a student who participated in a research project said, "Once I'm done with this project, I feel like I'll be able to keep approaching [redacted} future projects here." Additionally, research experience has supported the application of knowledge relevant to students' majors. On this point, one student stated, "Originally I didn't know anything about it so it was good experience. I'm glad I learned something." Another student found that, "It was a very valuable experience for me to work on this [research project] in the summer, and I'm looking forward to continuing this research for my senior project." And another student added, "I was able to learn the basics and apply it and put it all together." For more information related to student and faculty research, please see the "Student Accomplishments" section of the project website that is updated regularly with information on accomplishments: http://www.ecs.csun.edu/aims2/student_accomplishments.html.

AIMS$^2$ student participants seemed to recognize that research assistantships and engineering team competitions contributed to a sense of belonging at CSUN. Apart from their ability to instill confidence, they functioned as spaces for inclusion in engineering and computer science fields where AIMS$^2$ students felt a bit "out of place." One student described an experience related to this feeling: "This last semester I met some seniors that were in the program and we worked on a racecar. When I went in there they took me in. They made me feel like if I was one of them. It felt good." Additionally, another student had a similar experience conducting research with his faculty advisor and another professor: "I've worked with them. [They are] really nice, really helpful. They helped me feel comfortable here."

Although most of the interviewees had participated in research and indicated beneficial experiences, some participants detailed issues concerning being accepted for research positions as well as the practice of the research itself. Specifically, two of the students we spoke to had not conducted any research. Referring to their work

obligations, one participant stated, "I didn't have time to do any activities at the school. So the research is ten hours a week and I appreciate the offer and the opportunity. But this time, I can't do it." Students also expressed how grades could preclude them from research experience. This same student continued: "I was kind of limited because my GPA had dropped since I had gone back to work and wasn't able to maintain those grades as much as I would have wanted to."

Despite what these few students reported, the overall sentiment that emerged from the interviews pointed toward appreciation on the part of students who participated in faculty research. Cohort participants illustrated how research within the AIMS[2] program engendered valuable exposure to the field, application to their classes, and career opportunities. One participant shared, "This summer I'm working on the [redacted] with Dr. [redacted] so it's different research. I'm doing it as my senior design project." While another student said: "So I did research there and [redacted} always say, 'You're a perfect student for this or this. This [internship] is looking for these kinds of qualities.' …hopefully this semester I'll do more research with [redacted]." AIMS[2] faculty mentors and program administrators generally initiated contact with students in AIMS[2], urging them to apply to research positions and internships. Several faculty mentors shared how they met individually with AIMS[2] participants, and one faculty mentor in civil engineering summed up this approach: "I familiarized myself with the participants by meeting with each one of them individually." This was especially relevant to a computer science major who had recently graduated when he interviewed with us when he said "My advisor in AIMS[2] gave me a pep talk, saying, 'Don't worry about it. You're going to be fine. I have confidence that you will succeed at CSUN....' There have been a few occasions where my faculty advisor in AIMS[2] has pushed opportunities my way where she said, 'You should do this, you're the perfect candidate.' Another professor pushed me to do research. So [they all] motivated me." One other student believed that being involved in research has given her pause to think about future career paths. For example, she was not interested in coding, but after being involved in a research project she is now learning more coding languages. Others commented on the laboratories and equipment available. One student explained, "Joining AIMS allowed me the opportunity to be introduced to this laboratory that I didn't even know existed." And another said, "With the [redacted], we can actually save our data because [redacted] so it's a cool thing. I like it. And the other equipment is very modern. Whatever we ask [for], we can get it at the main equipment lab." Furthermore, working closely with AIMS[2] faculty members in a research capacity seemed to allow students to demonstrate their aptitude in the field. Such an environment creates opportunities for validation. To this point, one student reflected: "[Redacted] said, 'I would take you into my company.'" Similarly, interviewees recognize the influence that research experience has in the job market. As one student shared, "I figure if I put down working on a [redacted] [it] is pretty impressive." Importantly, the students also value the research prospects the program affords them, as indicated by the following statement: "If I wasn't in AIMS, I wouldn't have done the [reacted] project."

When faculty mentors shared their observations of student participation in summer research, they described an overall positive effect. For example, one faculty mentor stated: "We have made strong efforts to maintain the student research projects. It takes persistence to get students to commit to a schedule and consistently show up on time. It takes further effort to motivate them to do research that will result in fruitful outcomes." Another faculty mentor shared: "Students gained hands on experience with projects beyond their course work, which helped them to understand that the course work are important for research purposes. Student's commented that this is an amazing program helping with their academics as well as giving them an opportunity of research."

**Description of Project Activities Related to the Objective**
During the current performance period, faculty mentors worked to develop research-related activities with Cohort 5, Cohort 6, and Cohort 7 participants. In addition to the CSUN cohort students, faculty mentors also invited students from COC, GCC, Los Angeles Mission College (Mission), Los Angeles Pierce College (Pierce), Moorpark Community College (Moorpark) and/or Los Angeles Valley College (Valley) to join in planned activities. Current and/or planned activities that faculty mentors considered for Cohort 5, Cohort 6, and Cohort 7 participants, as well as those students invited from surrounding community colleges, include projects in one of their instructional labs and/or research labs, and participation in related student professional events, networking, and competitions (please see "**Description of Project Activities Related to the Objective**" for objectives 1 and 7 for more details). Further, faculty mentors facilitated research project group coordination and meetings (including the recruitment of cohort participants for summer research) as part of their faculty mentor sessions with cohort participants. With information from the AIMS[2] website, project staff, and faculty mentors, we can report the following Summer 2017 research projects with faculty mentors:

In addition to the project activities included above under College of the Canyons and Glendale Community College, CSUN faculty mentors facilitated interaction between themselves and COC and GCC students, as well as students from three other community colleges during the performance period. Specifically, select CSUN faculty mentors invited COC, GCC, Los Angeles Mission College (Mission), Los Angeles Pierce College (Pierce), Moorpark Community College (Moorpark) and/or Los Angeles Valley College (Valley) students to join CSUN students in faculty research projects at CSUN with CSUN faculty mentors in Summer 2017. The CSUN faculty mentors, research project names, and number of students (COC, GCC, Mission, Moorpark, Pierce, Valley, and CSUN) who participated in the projects are listed below:

**Professors Behzad Bavarian and Lisa Reiner:**
"Application of High Strength Aluminum Alloys for Aircraft Applications," "Corrosion Protection of Steel Pipes/Reinforced Concrete Structures Using Corrosion Inhibitors," and "Application of Low Melting Point Materials for Soldering" with 1 COC student and 2 CSUN students.

**Professor Bruno Osorno:**
"Electric Speed Drives Technology in Transportation (ESDTT)" with 1 GCC students and 2 CSUN students.

**Professor Vidya Nandikolla:**
"Eco Four-Wheel Drive," and "Autonomous Drone" with 1 GCC student, 1 Moorpark student, and 2 CSUN students.

**Professors Tzong-Ying Hao and Anwar Alroomi:**
"The Impact of a Team-Based, Experimental Research Project on Undergraduate Engineering Retention Rate" with 1 COC student, 1 GCC student, and 1 Moorpark student.

**Professors Tadeh Zirakian and David Boyajian:**
"Augmentation of a Structural Engineering Encounter (SEE) Active-Learning Laboratory Environment: Phase I" with 1 COC student and 3 Pierce students.

**Professor Vahab Pournaghshband:**
"Detection of Network Traffic Interference by Intermediaries on the Internet" with 2 COC students and 2 CSUN students.

**Professor Ruting Jia:**
"Solving Real World Problems by Using Intelligent Control Techniques" with 1 COC student and 1 GCC student.

**Professor S. Jimmy Gandhi:**
"Creation of an Entrepreneurial Mindset Among Undergraduate Students" with 2 COC students, 4 Pierce students, and 1 CSUN student.

**Professor John Valdovinos:**
"Low-Profile Wireless Power Receivers for Pediatric Circulatory Blood Pumps" with 1 CSUN student.

**Professor Bingbing Li:**
"Customized Orthodontic Brackets Created by Selective Laser Melting Process for Orthodontic Treatment," and "3D Bioprinting of Aneurysm Blood Vessel" with 1 COC student, 1 GCC student, 1 Moorpark student, and 1 Valley student.

**Professor Durgesh:**
"Experimental Study of Airfoils in the Wake of a Bluff Body" with 2 Pierce students.

In terms of the performance measures of this objective, these projects facilitated interaction between CSUN faculty, CSUN students, and COC/GCC students within a research context and supported the achievement of the objective.

Other project activities that facilitated cohort participation in faculty research activities included small group mentoring sessions with faculty mentors, individual faculty mentoring appointments and introduction to appropriate professional society student chapters in the discipline of the faculty mentor.

**Plans to Use of Performance Data to Monitor Progress**
With actual performance measure data for both measures in this project objective for this period, we have reported baseline and actual performance measure in this report.

Explanation of Progress (Include Qualitative Data and Data Collection Information)

**Evaluation Data Sources and Methods for the Objective**
**During the grant project period, we employed structured journals, observations, and interviews to assess the two performance measures of this objective with all partici-pants from Cohorts 1, 2, 3, 4, 5, 6, and 7. These three data collection procedures represent a mixed-methods approach with the collection of both quantitative and quali-tative data. In the student journals, guided by a set of close- and open-ended items, we asked respondents to indicate the number of interactions during the month and the types of interactions, including in-class interaction, faculty office hours, email contact, phone contact, Moodle interaction (online), supplemental lab session, faculty research project sessions, individual mentor appointment, group mentor meeting, on-campus project event, off-campus project event, or other event. Further, we asked cohort participants to describe their interactions with their faculty mentor during the month. More broadly, the AIMS$^2$ students who participated in a summer research project during this performance period, Summer 2017, presented their research projects to the project staff and faculty during the monthly meeting (October 4, 2017), which was a key opportunity for faculty mentors to interact with students, and for students to reflect on their experiences. Furthermore, we conducted cohort partici-pant interviews in Summer 2014 and early Fall 2014, which we detail below.**

*Interview Data Sources and Sample for Performance Measure 11b*
**In evaluating performance measure 10b, we analyzed a subsample of 24 interviews, all of which were conducted during Summer 2014 and early Fall 2014. Participants from the total sample were selected using a mixed sampling strategy of criterion and stratified purposeful sampling. Specifically, we used a criterion sample to select participants who met specific criteria for inclusion in the AIMS$^2$ program. These criteria include: a declared STEM major enrolled full-time in a CECS program; inclu-sion in a group that is economically, educationally, and environmentally disadvantaged or identification as Hispanic; and student transfer status. Additional criteria for inclusion in the interviews match AIMS$^2$ participation requirements, including the following: (a) pass all courses enrolled in each semester, (b) continue to be a declared STEM major, (c) enroll in a minimum of 12 units each semester, (d) earn a grade of "C+" or better in each class enrolled, and (e) participate in components of the pro-gram. In addition to the criterion strategy described above, we used stratified purposeful sampling in order to achieve a diverse sample. As such, we solicited interview participation from Cohorts 1, 2, 3 and 4 in Summer 2014 with a stratification based on gender, ethnicity, and program major. That is, we reviewed the full roster of AIMS$^2$ students in all cohorts and purposefully attempted to build a sample of students in specific strata. The goal of this sampling strategy was to create diverse groups by major, gender, and ethnicity. The sample of 24 interviews used to evaluate performance measure 10b reflects this diversity of the cohorts. With respect of student demographic characteristics, 19 interviewees identified as men and 5 as women, while 13 interviewees identified as Hispanic or Latino, 4 as Middle Eastern, 4 as White, 1 as Asian or Asian American, 1 as other, and 1 declined to state. As far as majors in engineering and computer science fields, 8 interviewees reported their major as mechanical engineering: 7 as computer science and computer information technology, 5 as electrical and computer engineering, 3 as civil engineering and construction management, and 1 as manufacturing systems engineering.**

*Interview Data Collection Instruments and Procedures for Performance Measure 11b*
**The primary instrument that we used to collect data from the 24 participants was an interview protocol. Overall, the interview protocol served to gather information from cohort participants related to validation and college-going capital in domains of family background, peer-peer interaction, student-faculty interaction, and aca-demic and career preparation. For example, we asked the participants to respond to the following questions: What did you expect CSUN to be like when you first got here? Do you feel like you had the right experiences in your upbringing to prepare yourself for college? Do you feel like you need to have a certain background to be in your major? Have there been any situations where someone has taken an active interest in you, or thought you were capable of doing something, to get you more in-volved in your education? Using the interview protocol, we conducted one-on-one, 60-minute personal interviews with students from Cohorts 1, 2, 3, and 4, whom we invited to participate in the interviews through email. Once we received their response, we set times and dates for the interviews when both the particular student and one of the researchers could meet. The Dean's office arranged a secure, quiet room available for the interviews, which we conducted during Summer/early Fall 2014. To maintain and store confidential interview information, we assigned each cohort participant a three-digit random number. During the interview session, we shared an informed consent form with participants and audio recorded the session. Upon completion of the interviews, we transcribed the audio files into a de-identified data file. The recorded audio files were subsequently destroyed. We stored the transcribed files on a password-protected, secure laptop**

*Interview Data Analysis Procedures for Performance Measure 11b*
After transcription, we proceeded with coding and thematic data analysis using ATLAS.ti, a computer-aided qualitative data analysis software program. Specifically, we used the themes that emerged from the ATLAS.ti analysis and from codes developed in hard copy transcribed data files. We then categorized the themes that emerged from codes that we clustered according to experiences and interactions of the cohort participants. These categories were used to align thematic findings to the performance measures associated with program objectives. Finally, we extracted direct quotes taken from the interviewees to illustrate themes and support overall findings.

**Description of Preliminary Findings Related to the Objective**
Below we report actual performance data for all three measures for Project Years 1, 3, and 6.

*Preliminary Findings for Cohort 1 in Project Year 1: Performance Measure 11a*
To support the development of cohort baseline figures for the first performance measure, during the Cohort 1 (Spring 2012) applicant interview we asked interviewees the number of student-faculty interactions that they had in the Fall 2011. Results from interview responses suggested that students in the first (Spring 2012) cohort logged a total of 443 separate interactions with faculty in Fall 2011 prior to cohort entry in Spring 2012. This figure represents the baseline data for the first performance measure (11a), which serves to set the Cohort 1 project target of 842 total interactions between students and faculty. When we examined actual performance data for the first measure (11a), collected through September 2012, we found that students reported in their journal entries that they had 634 total interactions with faculty. This figure (n=634) represents an increase over the baseline figure (n=443) and indicates progress in meeting the project objective to increase student-faculty interaction by 90% during the project period. In fact, the total number of interactions between cohort participants and faculty mentors represents 75% of the target (n=842) number of interactions.

*Preliminary Findings for Cohorts 2 and 3 in Project Year 3: Performance Measure 11a*
During Cohort 2 (formation in Fall 2012) applicant interviews and Cohort 3 (formation in Fall 2013) questionnaire administration, we asked interviewees the number of student-faculty interactions that they had in the Fall 2012 (Cohort 2) and Spring 2013 (Cohort 3)—to establish baseline data. Results from interview and questionnaire responses suggested that students in Cohort 2 logged a total of 95 separate interactions with faculty in Spring 2012 prior to cohort entry in Fall 2012 and students in Cohort 3 recorded 36 discrete interactions with faculty in Spring 2013 prior to cohort entry in Fall 2013. These figures represent the respective cohort baseline data for the first performance measure (11a) and set the respective project targets of 181 (Cohort 2) and 68 (Cohort 3) total interactions between students and faculty. When we examined actual performance data for the first measure (11a), we found that Cohort 2 students reported that they had 834 total interactions with faculty in the third performance period, a dramatic increase over the number of interactions (n=597) reported during the previous performance period that exceeds the project target (n=181) for Cohort 2 on this measure. Meanwhile, Cohort 3 students recorded a total of 302 interactions with faculty during the period, which clearly indicates that Cohort 3 surpassed the project target of 68 interactions. These figures (n=834 for Cohort 2 and n=302 for Cohort 3) represent increases over the respective baseline figures (n=181 for Cohort 2 and n=68 for Cohort 3) for both cohorts and demonstrate achievement of the performance measure to increase student-faculty interaction by 90% for both cohorts.

*Preliminary Findings for Cohorts 5, 6, and 7: Performance Measure 11a*
During Cohort 5 (formation in Fall 2014), Cohort 6 (formation in Fall 2015), and Cohort 7 (formation Fall 2016) questionnaire (monthly structured journal) administration, we asked interviewees the number of student-faculty interactions that they had prior to Fall 2014 (Cohort 5), Fall 2015 (Cohort 6), and Fall 2016 (Cohort 7)—to establish baseline data. Results from the questionnaire responses suggest that students in Cohort 5 recorded 42 discrete interactions with faculty in Spring 2014 prior to cohort entry in Fall 2014, students in Cohort 6 logged a total of 25 separate interactions with faculty in Spring 2015 prior to cohort entry in Fall 2015, and students in Cohort 7 reported 161 unique interactions with faculty in Spring 2016 prior to cohort entry in Fall 2016. These figures represent the respective cohort baseline data for the first performance measure (11a) and set the respective project targets of 80 (Cohort 5), 48 (Cohort 6), and 306 (Cohort 7) total interactions between students and faculty. When we examine actual performance data for the first measure (11a), we find that Cohort 5 students reported that they had 101 total interactions with faculty in the current performance period, which exceeds the project target (n=80) for Cohort 5 on this measure. Meanwhile, Cohort 6 students recorded a total of 49 interactions with faculty during the period, which exceeds the project target of 48 interactions for Cohort 6. Additionally, Cohort 7 students logged a total of 462 interactions with faculty during the period, which exceeds the project target of 306 interactions for Cohort 7. These figures (n=80 for Cohort 5, n=49 for Cohort 6, and n=462 for Cohort 7) represent increases over the respective baseline figures (n=42 for Cohort 5, n=25 for Cohort 6, and n=161 for Cohort 7) for each cohort and demonstrate

continued progress toward meeting the project objective (via Cohorts 5, 6, and 7) related to achievement of the performance measure to increase student-faculty interaction by 90% for all cohorts.

*Preliminary Findings for All Cohorts Throughout the Grant*
Of the measures dependent on student response to structured journal questions, the first performance measure (11a) of this objective yielded the highest rate of achievement and strongest results.  With the exception of Cohort 1 during the first performance period, and Cohort 4 during the fifth performance period, the results of this performance measure achieved expectations, and in two instances quadrupled cohort project targets (Cohorts 2 and 3 in the third performance period).  Overall, through the project activities outlined below, these data demonstrate strong progress related to the achievement of the performance measure to increase student-faculty interaction by 90% for all cohorts.

*Preliminary Findings for Cohorts 1, 2, 3, and 4 in Project Year 4: Performance Measure 11b*
Performance measure 11b relates to the quality of student-faculty interaction. After observing the Student Research Symposium and thematic analysis of transcribed interview data, we found that cohort participants generally maintained meaningful interactions with their faculty mentors.  Moreover, many of the 24 individuals interviewed expressed beneficial and worthwhile relationships with their assigned faculty members. The causes for these attitudes include faculty mentors offering information related to studying, resources, and classes.  To this point, one student said, "I get a lot from the professors experience; whenever I had questions, I'd find their office hours and I get help from them."  More specifically, one student noted, "I would ask ways to improve my studying in order to get better grades. How can I improve myself? What kind of sources can I get in order to get a better understanding of the concepts taught in class? They were really helpful with these things." Another student agreed: "I always sought guidance from Prof. [redacted] here. [Redacted] was kind of like the person to go to if I had any issues for any problems. I'm not able to take this class. What can I do? {Redacted} would offer different suggestions, different paths I could take." While yet another student expressed a similar situation: "Dr. [redacted] gave us advice and told us what we needed to do and asked how we were doing."  Through observation of the Student Research Symposium, we found that there were also meaningful interactions between students and faculty mentors through research participation.  While working in research laboratories, students had the opportunity to interact with faculty and supplement what they were learning in class, or even gain experience with new theories ahead of time.  One student said, "It was nice to get a heads up on what's coming in the upcoming year as far as academics."  Having the opportunity to learn from faculty outside of the classroom increased their confidence in their academic studies.  This sentiment of the benefit of working with faculty on research projects was echoed by another student when she said, "As transfer students we found this experience to be super rewarding.  Not only did we become more familiar with campus, but also the things we would be learning."  This student noted the academic advantage to working with faculty on a summer research project, but also noted how helpful it was to become familiar with the campus and faculty before her first semester in attendance.

In a more coordinated setting, weekly faculty mentor meetings structured AIMS$^2$ student experiences as more than academic; they frequently were opportunities to develop *social* skills, such as public speaking, elevator pitching, and interfacing with influential players in the industry. The frequent result for participants in this study: confidence in the skills needed to succeed in a career. As one student expressed, "That confidence helped me be more outgoing and approach people." Another student was more descriptive when stating, "I knew it was a necessity. Computer science majors might say, 'I'll just be in front of a computer for 16 hours a day.' But eventually you got to contact somebody. Especially for the interviews, right? Even though you're in a major full of introverts, you have to get it in your mind that if you can talk to people at whatever level it makes the entire process a lot easier. For example, when you're being interviewed by people in business, it's good able to go to their level and basically make a connection."  Other AIMS$^2$ faculty mentors often co-constructed weekly participant meetings, allowing students to set the agenda for what they would accomplish during these meetings.  A computer information technology major and a veteran, explained how this worked in his group when he stated, "My faculty advisor gives us the freedom to work on the projects we do in the club. An example of that would be every semester that I've been part of the AIMS program we really don't have an agenda or anything specific to work on—we just kind of have some rules and things that we lay out for each other to help us keep learning every way we can. From that, we pretty much come up with projects we want to work on every semester and because she gives us the freedom to pick the project that we want to work on no matter how difficult it might seem, if we get stuck she'll bring in either former students or in the field to give us a little bit of help. And because she gives us so much freedom I think that's where we just get the confidence."  In this way, participants tended to view themselves as capable at some aspect of their field.

While faculty mentors have proved to be a trove of information for pathways at CSUN, they have also given advice to AIMS$^2$ members regarding the STEM industry, professional association memberships, professional internships, and job opportunities. One student shared: "[Redacted] helped me a lot with the internship. [Redacted] was really friendly and [redacted] helped me to get familiar with my courses. Those were the main things that helped me get very comfortable here." In addition, several faculty mentors are in the habit of sending job and internship opportunities via email, as demonstrated by the following quote: "They tell you about all of the internships

and opportunities going on. There's always an email from [redacted]. [Redacted] always sending out a bunch of emails about opportunities. [Redacted] always showing us these are the jobs that match your field." And another student shared a similar experience when they stated: "[redacted] send me emails if there are any internships related to my major."  In some instances, faculty members have detailed their previous career experiences before coming to CSUN, lending unique insight to students for what lies ahead. On this point, one cohort participant stated, "Dr. [redacted] used to work for [redacted] also but [redacted] stopped and started teaching. I asked [redacted] once why [redacted] did that and [redacted] just said [redacted] preferred teaching. [Redacted] got a Ph.D. in engineering and started teaching."

Overall, though, the general support and encouragement that the faculty mentors provide seems to be their most effective qualities. As one student expressed, "So it's really nice. The professor explained everything to me and everything was great. [Redacted] really helps me a lot." In one instance, a faculty mentor provided encouragement for a student who had just been told by a different professor to switch majors. The student reflected, "I even told Dr. [redacted] about it. And [redacted] just told me that [it was] strange but you should just blow it off. Just do better and show him different." Additionally, faculty members can turn their regular weekly meetings with AIMS$^2$ participants into a quasi-support group. For example, one student stated, "We meet every week and we meet for about an hour or two hours with Dr. [redacted] and [redacted] two advisors are there…so then we have access to them. Apart from that they also give us their email and phone number and make themselves very accessible." At these meetings, faculty mentors can imbue students with confidence and the ability to take risks. Indeed, one participant described, "[Redacted] still goes ahead and gives us confidence and when we get to points where we might be stuck [redacted] shall bring in either former students or people in the field to give us a little help and we'll go from there. And because [redacted] gives us so much freedom I think that's where we get the confidence from that." The preceding quotes paint a picture of the beneficial interaction between AIMS$^2$ cohort members and their faculty members. A participant member sums it up nicely: "If I wasn't in the AIMS program then I probably would have floundered a little bit…but I had that support group."

<u>Description of Project Activities Related to the Objective</u>
Overall, project activities are intended to facilitate frequent and quality student-faculty interaction in the current performance period.  To that end, faculty mentors met regularly with their cohort participants to foster a faculty mentoring relationship; plan project activities; and to design research activities.  More specifically, faculty mentoring with cohort participants facilitated the development of the peer tutor/mentor relationships, academic advisement and individual student meetings, supervision of student club/organization and club start-up, and coordination and facilitation of small group workshops.  Additionally, faculty mentoring relationships tended to facilitate more frequent communication with cohort participant through multiple modes of communication such as email messages and phone calls.  One result of these exchanges is that students secured permission numbers for closed classes for cohort participants.  More broadly, the AIMS$^2$ project participants presented the Summer 2017 research projects to the project staff and faculty during the monthly meeting (October 4, 2017), which was a key opportunity for faculty mentors to interact with students.  Furthermore, AIMS$^2$ socials have supported interaction with faculty mentors.  We should note that as upcoming events and activities approached, they were included on a calendar on the project's website (http://www.ecs.csun.edu/aims2/).  Finally, the iPad initiative appears to have facilitated contact between faculty and students.  First, we should note that iPads were only provided in the second, third, fourth, and fifth project years, and consequently Cohort 7 participants did not receive an iPad.  Also, data collection on iPad use did not begin until the third project period.  Yet when we review iPad use across the cohorts, we see that all cohorts with recorded iPad use reported using the iPad 3,887 times during the month of October during the project period.  For a complete picture of iPad use during the project period, please see the table of distribution of iPad use by cohort and month below:

iPad Use by Month and Cohort, AIMS$^2$ Cohort Participants, Cohorts 2, 3, 4, 5 and 6, October 2011-September 2017

**Not surprisingly, looking at iPad use across all cohorts, the peak months for iPad use among students included October through November and April through May (with April the highest recorded month in the period). When we explore how students used the iPad, we find that they reported academic and social functions that support their work as students. One student shared: "The ipad has become integral to my academic life. It houses all my notes, assignments, appointments, and even text-books." Another student noted, "My iPad has drastically improved my academic experience. I can do all my homework on my iPad and read all my books. Also, I found a way to use, programs typically used on PC's, on my iPad." Finally, a student detailed: "I am very fortunate to have the iPad. It has been extremely useful. I use it daily to access information including classes, books, research, etc. I have transitioned to using it to take notes for several classes." Further, some students reported using the iPad for specific engineering and math applications. On this note, a student described: "I've been using "computer networking" app lately. It gives me lots of infor-mation about Cisco, preparing me to get a Cicso certificate." Another student shared, "I've found a few apps that have made note taking quicker and easier allowing me to consolidate notes and wirelessly share them with peers. I've also found fast math apps that make mathematical calculations quicker when doing lab reports." Beyond general academic and specific engineering and math functions, students report iPad use for communication and social reasons. Here, one student noted, "My iPad is so useful. I take it will me to school everyday and I use it everyday for both recreational and academic purposes. I use it everyday to communicate via email to my profes-sors and peers. In fact I'm using my iPad to fill out this journal entry right now." Another student shared: "The most useful thing I use my iPad for is to check Moodle for anything new my professors post. It allows me to keep updated for anything new that my professors want us to have access to. Almost all of my professors use moodle and it helps me keep on top of my studies and keep in contact with my professors." Finally, a student detailed how he or she used the iPad for "emails, networking with others, note-taking, saving pictures of the board for later reference, and lately, for sharing those special moments such as graduation pictures in social networks."**

**Plans to Use of Performance Data to Monitor Progress**
**During the grant period, data collection for both performance measures (11a and 11b) demonstrated substantive progress toward achieving this project objective. With the results from monthly student journaling and student interviews from Summer 2014/early Fall 2014, we have presented actual performance data for both measures to the project team. Further, we have used results from data collection in both Moodle and interviews to monitor progress in meeting this objective. Specifically, we have used Moodle cohort participant journal results to assess further progress on the first performance measure (11a) and student interviews to evaluate progress on the second performance measure (11b).**

Explanation of Progress (Include Qualitative Data and Data Collection Information)

**Evaluation Data Sources and Methods for the Objective**
*Quantitative Data Sources and Data Collection Procedures for Performance Measures 12a, 12b, and 12c*
**For these three performance measures of this objective, data collection for all cohorts, during their respective performance periods, included cohort participant recruitment interviews/questionnaire administration (baseline data) and cohort participant structured journaling (actual performance data). Specifically, baseline data collection occurred with questionnaire administration in the cohort recruitment cycles in early Spring 2012 (Cohort 1), early Fall 2012 (Cohort 2), early Fall 2013 (Cohort 3), early Spring 2014 (Cohort 4), early Fall 2014 (Cohort 5), early Fall 2015 (Cohort 6), and early Fall 2016 (Cohort 7). During the questionnaire administration process, we asked cohort applicants the number of peer-tutoring and peer-mentoring sessions that they had in the one or two terms (i.e., six months) prior to program entry. In addition to data collection for the baseline measures, data collection to measure actual performance on the four measures consists of survey data collection (e.g., cohort journaling) and student interviews. With respect to the former, we included items to assess performance in these measures related to peer-peer interaction. In their journals, we asked cohort participants to indicate the number and types of interactions with peer mentors, peer tutors, and fellow cohort participants. The types of interactions under these three categories included: in-class interaction, Moodle interaction (online), email contact, phone contact, text message contact, social media interaction, faculty research session, supplemental lab session, group mentor/tutor session, on-campus project event, off-campus project event, and other event. Once submitted, we created Excel data extracts and then aggregated the number of peer tutoring, peer mentoring, and peer-peer interactions across cohorts.**

*Interview Data Sources and Sample for Performance Measure 12d*
**In evaluating performance measure 10b, we analyzed a subsample of 24 interviews, all of which were conducted during Summer 2014 and early Fall 2014. Participants from the total sample were selected using a mixed sampling strategy of criterion and stratified purposeful sampling. Specifically, we used a criterion sample to select participants who met specific criteria for inclusion in the AIMS[2] program. These criteria include: a declared STEM major enrolled full-time in a CECS program; inclusion in a group that is economically, educationally, and environmentally disadvantaged or identification as Hispanic; and student transfer status. Additional criteria for inclusion in the interviews match AIMS[2] participation requirements, including the following: (a) pass all courses enrolled in each semester, (b) continue to be a declared STEM major, (c) enroll in a minimum of 12 units each semester, (d) earn a grade of "C+" or better in each class enrolled, and (e) participate in components of the program. In addition to the criterion strategy described above, we used stratified purposeful sampling in order to achieve a diverse sample. As such, we solicited interview participation from Cohorts 1, 2, 3 and 4 in Summer 2014 with a stratification based on gender, ethnicity, and program major. That is, we reviewed the full roster of AIMS[2] students in all cohorts and purposefully attempted to build a sample of students in specific strata. The goal of this sampling strategy was to create diverse groups by major, gender, and ethnicity. The sample of 24 interviews used to evaluate performance measure 10b reflects this diversity of the cohorts. With respect of student demographic characteristics, 19 interviewees identified as men and 5 as women, while 13 interviewees identified as Hispanic or Latino, 4 as Middle Eastern, 4 as White, 1 as Asian or Asian American, 1 as other, and 1 declined to state. As far as majors in engineering and computer science fields, 8 interviewees reported their major as mechanical engineering: 7 as computer science and computer information technology, 5 as electrical and computer engineering, 3 as civil engineering and construction management, and 1 as manufacturing systems engineering.**

*Interview Data Collection Instruments and Procedures for Performance Measure 12d*

The primary instrument that we used to collect data from the 24 participants was an interview protocol. Overall, the interview protocol served to gather information from cohort participants related to validation and college-going capital in domains of family background, peer-peer interaction, student-faculty interaction, and academic and career preparation. For example, we asked the participants to respond to the following questions: What did you expect CSUN to be like when you first got here? Do you feel like you had the right experiences in your upbringing to prepare yourself for college? Do you feel like you need to have a certain background to be in your major? Have there been any situations where someone has taken an active interest in you, or thought you were capable of doing something, to get you more involved in your education? Using the interview protocol, we conducted one-on-one, 60-minute personal interviews with students from Cohorts 1, 2, 3, and 4, whom we invited to participate in the interviews through email. Once we received their response, we set times and dates for the interviews when both the particular student and one of the researchers could meet. The Dean's office arranged a secure, quiet room available for the interviews, which we conducted during Summer/early Fall 2014. To maintain and store confidential interview information, we assigned each cohort participant a three-digit random number. During the interview session, we shared an informed consent form with participants and audio recorded the session. Upon completion of the interviews, we transcribed the audio files into a de-identified data file. The recorded audio files were subsequently destroyed. We stored the transcribed files on a password-protected, secure laptop

*Interview Data Analysis Procedures for Performance Measure 12d*
After transcription, we proceeded with coding and thematic data analysis using ATLAS.ti, a computer-aided qualitative data analysis software program. Specifically, we used the themes that emerged from the ATLAS.ti analysis and from codes developed in hard copy transcribed data files. We then categorized the themes that emerged from codes that we clustered according to experiences and interactions of the cohort participants. These categories were used to align thematic findings to the performance measures associated with program objectives. Finally, we extracted direct quotes taken from the interviewees to illustrate themes and support overall findings.

**Description of Preliminary Findings Related to the Objective**
With student journaling in Cohorts 1, 2, 3, 4, 5, 6, and 7 and student interviews with Cohorts 1, 2, 3, and 4, we report actual performance data for performance measures 12a, 12b, and 12c for the first, third, and sixth project year. In addition to the procedures described above, student interviews are used here to assess the fourth performance measure (12d).

*Preliminary Findings for Cohort 1 in Project Year 1: Performance Measures 12a, 12b, and 12c*
Baseline data aggregated from results of Cohort 1 (Spring 2012) questionnaire administration (see section immediately above) indicate that the total number of students who participated in peer-tutoring and peer-mentoring in the Fall 2011 term is 26 and 18, respectively. In addition, results from document data collection of college records reveals that prior to Cohort 1 no students (outside of a graduate program in assistive technology) participated in a cohort model. These figures represent the baseline measures for two of these four measures, respectively, for Cohort 1. In light of these baseline measures and given the project target percent increases (30% for all three measures), the Cohort 1 project targets for these three measures are 1 student (12a), 34 students (12b), and 23 students (12c). During the performance period, actual performance data for the three measures reveals that two measures have been met (12a and 12c). Specifically, with respect to performance measure 12a (cohort participation), with the formation and induction of 30 students in Cohort 1 (Spring 2012), there are 30 students who now participate in a cohort model, which supports that conclusion that we have exceeded the project target (i.e., 30% increase over the baseline) for this performance measure. That is, with the 30 cohort participants in Cohort 1 (Spring 2012), we have exceeded the target of a 30% increase over the baseline (n=0). Furthermore, we see data from student structured journals during the performance period for this report that show that we have met performance measure 12c with reporting having participated in peer mentoring sessions. The second performance measure—12c—that has been met during the period relates to peer mentoring among cohort participants. With this performance measure, we find that 26 students (or 87% of cohort participants) reported having participated in peer mentoring activities. Indeed, actual performance data for this measure represent an increase over the baseline figure (n=23) and an increase over the baseline ratio (18/30 or 60% of all cohort participants). As a result, performance data demonstrate that the number and percentage of students in Cohort 1 exceeds the project target (23/30 or 77%) by 10%. When we turn to performance measure 12b, we find that 23 of 30 students in Cohort 1 (or 77% of all cohort participants) engaged in peer tutoring. These figures are consistent with actual performance data from measure 9a (tutoring). In light of the baseline data (26/30 or 87% of all cohort participants), we can conclude that actual performance data on this measure demonstrates progress toward the project target of 30/30 students or 100% of all students in Cohort 1. While the number of students who participated in peer tutoring during the period did not exceed the baseline data or project target, the figure we have reached a large majority of cohort participants through facilitating peer-tutoring opportunities.

*Baseline Data for Cohorts 2 and 3 in Project Year 3: Performance Measures 12a, 12b, and 12c*
Baseline data aggregated from results of Cohort 2 (Summer 2013) applicant interviews (see section above) indicate that the total number of students who participated in peer tutoring and peer mentoring in the Fall 2011 term is 17 and 9, respectively. In addition, results from document data collection of college records reveal that prior to

Cohort 2 program entry, no students participated in a cohort model. These figures represent the baseline measures for all three measures, respectively, for Cohort 2. With Cohort 3, we find that no students (n=0) reported participation in a cohort model prior to program entry. We note that while all nine Cohort 3 participants participated in AIMS[2] at Glendale Community College or College of the Canyons prior to program entry at CSUN, questionnaire respondents did not appear to interpret their pre-transfer, community college AIMS[2] experiences as participation in a cohort model. Further, we identify 5 and 7 students—respectively—who participated in peer tutoring and peer mentoring prior to program entry. With these baseline data and project target increases of 30% for the three measures, we set project targets for Cohort 2 at 1/29 students (or 3% of all cohort participants) for 12a, 22/29 students (or 76% of all cohort participants) for 12b, and 9/29 students (or 31% of all cohort participants) for 12c. In light of these baseline data and the project target percent increases (30% for all three measures), the Cohort 3 project targets for these three measures are 1/9 student (12a) or 11% of all cohort participants, 7/9 students (12b) or 78% of all cohort participants, and 9/9 students (12c) or 100% of all cohort participants.

*Overview of Preliminary Findings for Cohort 2 and 3 in Project Year 3: Performance Measures 12a, 12b, and 12c*
During the performance period, actual performance data for the three measures reveal mixed results across cohorts. Not surprisingly, data demonstrate that one measure—cohort model participation (12a)—exceeded project targets for both cohorts. Further, data for performance measure 12b show that the number of students who participated in peer tutoring did not exceed project targets for both cohorts, while data for performance measure 12c indicate that the number of students who participated in peer mentoring approached the project target for Cohort 2 and exceeded the project target for Cohort 3.

*Preliminary Findings for Cohorts 2 and 3 in Project Year 3: Performance Measure 12a*
With respect to performance measure 12a (cohort participation), with the formation and induction of 38 students in Cohort 2 in Fall 2012 and Cohort 3 in Fall 2013, there are 29 students (Cohort 2) and 9 students (Cohort 3) who have participated or currently participate in a cohort model, which supports the conclusion that we have exceeded the project target (i.e., 30% increase over the baseline) for this performance measure. That is, with the 29 (29/29 or 100%) current Cohort 2 and 9 (9/9 or 100%) Cohort 3 participants, we have exceeded the targeted 30% increase over the baseline (n=0) for both cohorts.

*Preliminary Findings for Cohorts 2 and 3 in Project Year 3: Performance Measure 12b*
As far as the second performance measure—12b or peer tutoring—we find that 10 students (or 34% of cohort participants) in Cohort 2 reported having participated in peer tutoring activities during the period—a decrease of 11 (n=21) students from the previous performance period. In Cohort 3, 7 students (7/9 or 78%) reported participation in peer tutoring during the period. Consequently, actual performance data for this measure represent mixed outcomes across cohorts: a decrease over the baseline (n=17) for Cohort 2 but an increase over the baseline (n=5) for Cohort 3. These figures are consistent with actual performance data from measure 9a (tutoring) for both cohorts. When assessed as a function of projects target, performance data demonstrate that we continue to log steady and substantive progress on this performance measure for Cohort 2 (34% actual vs. 75% target) and Cohort 3 (78% actual vs. 78% target). When we examine peer-tutoring participation by major, we find that students across all majors participated in peer tutoring.

Peer Tutoring Participation by Major and Cohort, AIMS[2] Cohort Participants, Cohorts 2 and 3, October 2013-September 2014

| **Major** <br><br>**Cohort** | *Civil Engineering and Construction Management* | *Computer Science* | *Computer Information Systems* | *Electrical Engineering* | *Manufacturing Systems Engineering* | *Mechanical Engineering* | **TOTAL** |
|---|---|---|---|---|---|---|---|
| Cohort 2 | 2 | 3 | 1 | 2 | 1 | 1 | **10** |
| Cohort 3 | 0 | 1 | 1 | 4 | 0 | 1 | **7** |
| **TOTAL** | **2** | **4** | **2** | **6** | **1** | **2** | **17** |

As we see in the table above, computer science (n=4) and electrical engineering (n=6) recorded the most students who participated in tutoring. Finally, while more students from Cohort 2 participated in tutoring (10 in Cohort 2 vs. 7 in Cohort 3), a greater percentage of Cohort 3 students (78%) engaged in peer tutoring during the performance period.

*Preliminary Findings for Cohorts 2 and 3 in Project Year 3: Performance Measure 12c*
When we look at performance measure 12c, we see that 22 of 29 students in Cohort 2 (or 76% of all Cohort 2 participants) and 3 of 9 students in Cohort 3 (or 33% of all Cohort 2 participants) engaged in peer mentoring during the performance period. In light of the baseline data (7/29 or 24% of all cohort participants), we can conclude

that actual performance data on this measure demonstrates progress on the performance measure (project target: 9/29 students or 31% of all students) for Cohort 2 but shows a decline on performance measure in comparison to data from the 2012-13 project period (21/29 students).  We may speculate that the decline in the number of students in Cohort 2 who participated in peer mentoring could be related to the fact that their academic standing moved from junior-level to senior-level with some of their peer mentors graduating at the end of the 2013-14 period.  When we look at the data for Cohort 3, three students (33% or 3/9 students) reported participation in peer mentoring.  For Cohort 3, these data indicate that the performance measure has not been achieved for the period (33% actual vs. 100% target).

*Baseline Data for Cohorts 5, 6, and 7 in Project Year 6: Performance Measures 12a, 12b, and 12c*
Through baseline data aggregated from results of Cohort 5 questionnaires, we find that no students (n=0) reported participation in a cohort model prior to program entry.  Further, in Cohort 5 we identify 5 and 5 students—respectively—who participated in peer tutoring and peer mentoring prior to program entry.  With Cohort 6, questionnaire responses indicate that the total number of students who participated in peer tutoring and peer mentoring in the Spring 2015 term is 3 and 2, respectively.  In addition, results from document data collection of college records reveal that prior to Cohort 6 program entry, no students participated in a cohort model (n=0).  In addition, results of Cohort 7 questionnaires find that no students (n=0) reported participation in a cohort model prior to program entry.  And in Cohort 7 we identify 9 and 3 students—respectively—who participated in peer tutoring and peer mentoring prior to program entry. These figures represent the baseline measures for all three measures, for Cohort 7.  With these baseline data and project target increases of 30% for the three measures, we set project targets for Cohort 5 at 1/9 students (12a) or 11% of all cohort participants, 7/9 students (12b) or 78% of all cohort participants, and 5/9 students (12c) or 56% of all cohort participants.  In light of these baseline data and the project target percent increases (30% for all three measures), the Cohort 6 project targets for these three measures are 1/6 students (or 17% of all cohort participants) for 12a, 4/6 students (or 67% of all cohort participants) for 12b, and 3/6 students (or 50% of all cohort participants) for 12c.  Additionally, with consideration of these baseline data and the project target percent increases (30% for all three measures), the Cohort 7 project targets for these three measures are 1/27 students (or 4% of all cohort participants) for 12a, 12/27 students (or 44% of all cohort participants) for 12b, and 4/27 students (or 15% of all cohort participants) for 12c.

*Overview of Preliminary Findings for Cohorts 5, 6, and 7 in Project Year 6: Performance Measures 12a, 12b, and 12c*
During the performance period, actual performance data for the three measures reveal mixed results across cohorts.  Not surprisingly, data demonstrate that one measure—cohort model participation (12a)—exceeded project targets for all three cohorts.  Further, data for performance measure 12b show that the number of students who participated in peer tutoring did not exceed project targets for all three cohorts, and data for performance measure 12c indicate that the number of students who participated in peer mentoring lagged behind the project target for cohorts 5 and 6, but exceeded the project target for cohort 7.

*Preliminary Findings for Cohorts 5, 6, and 7 in Project Year 6: Performance Measure 12a*
With respect to performance measure 12a (cohort participation), with the formation and induction of 42 total students in Cohort 5 (n=9) in Fall 2014, Cohort 6 (n=6) in Fall 2015, and Cohort 7 (n=27) in Fall 2016, there are 9 students (Cohort 5), 6 students (Cohort 6), and 27 students (Cohort 7) who currently participate in a cohort model, which supports the conclusion that we have exceeded the project target (i.e., 30% increase over the baseline) for this performance measure.  That is, with the 9 (9/9 or 100%) current Cohort 5, 6 (6/6 or 100%), and 27 (27/27 or 100%) Cohort 7 participants, we have exceeded the targeted 30% increase over the baseline (n=0) for all three cohorts.

*Preliminary Findings for Cohorts 5, 6, and 7 in Project Year 6: Performance Measure 12b*
As far as the second performance measure—12b or peer tutoring—we find that 0 students (or 0% of cohort participants) in Cohort 5 reported having participated in peer tutoring activities during the period—a decrease of 1 (n=1) student from the previous performance period.  In Cohort 6, we find that 1 student (or 17% of cohort participants) reported having participated in peer tutoring activities during the period—a decrease of 3 (n=4) students from the previous performance period. In Cohort 7, 10 students (10/27 or 37%) reported participation in peer tutoring during the period.  Consequently, actual performance data for this measure represent a decrease over the baseline (n=5) for Cohort 5, a change over the baseline (n=3) for Cohort 6, and an increase over the baseline (n=9) for Cohort 7.  These figures remained the same as actual performance data from measure 9a (tutoring) for all cohorts. When assessed as a function of projects target, performance data demonstrate that we continue to log steady and substantive progress on this performance measure for Cohort 5 (0/9 or 0% actual vs. 7/9 or 78% target), Cohort 6 (1/6 or 17% actual vs. 4/6 or 67% target), and Cohort 7 (10/27 or 37% actual vs. 12/27 or 44% target).  When we examine peer-tutoring participation by major, we find that—between Cohorts 5, 6, and 7—students across several majors participated in peer tutoring and higher percentage of students in Cohort 7 than Cohorts 5 and 6 participated in peer tutoring.

Peer Tutoring Participation by Major and Cohort, AIMS[2] Cohort Participants, Cohorts 5, 6, and 7, October 2016-September 2017

| *Major* / **Cohort** | *Civil Engineering and Construction Management* | *Computer Science* | *Computer Information Systems* | *Electrical Engineering* | *Manufacturing Systems Engineering* | *Mechanical Engineering* | **TOTAL** |
|---|---|---|---|---|---|---|---|
| Cohort 5 | 0 | 0 | 0 | 0 | 0 | 0 | **0** |
| Cohort 6 | 0 | 0 | 0 | 1 | 0 | 0 | **1** |
| Cohort 7 | 1 | 2 | 0 | 4 | 1 | 2 | **10** |
| **TOTAL** | **1** | **2** | **0** | **5** | **1** | **2** | **11** |

As we see in the table above, civil engineering and construction management (n=1), computer science (n=2), electrical engineering (n=5), manufacturing systems engineering (n=1), and mechanical engineering (n=2) each recorded students who participated in tutoring. Finally, more students from Cohort 7 participated in peer tutoring (0 in Cohort 5 vs. 1 in Cohort 6 vs. 10 in Cohort 7) during the performance period.

*Preliminary Findings for Cohorts 5, 6, and 7 in Project Year 6: Performance Measure 12c*
When we look at performance measure 12c for Cohort 5, no students (0% or 0/9 students) reported participation in peer mentoring. For Cohort 5, these data indicate that the performance measure has not been achieved for the period (0% actual vs. 56% target). When we look at the data for Cohort 6, we see that 1 of 6 students in Cohort 6 (or 17% of all Cohort 6 participants) engaged in peer mentoring during the performance period. For Cohort 6, these data indicate that the performance measure has not been achieved for the period (17% actual vs. 50% target). And when we look at the data for Cohort 7, 9 students (33% or 9/27 students) reported participation in peer mentoring. In light of the data, we can conclude that the performance measure has been achieved (33% actual vs. 15% target) for Cohort 7.

*Preliminary Findings for All Cohorts Throughout the Grant*
Each cohort exceeded project targets set for participation in the cohort model. This trend was maintained across each performance period and all seven participating cohorts. Additionally, each cohort demonstrated a strong commitment to peer tutoring and peer mentoring with cohort participation in their first year, and followed with a decline in peer tutoring and peer mentoring sessions recorded in their respective second years (with the exception of Cohorts 2 and 3 in performance measure 12c in which they maintained their level or participation). We note that across each cohort there was not a high response rate in the monthly journal submissions in the second year of each cohort. They may not have demonstrated a level of participation in these areas because they were moving toward senior-standing. Considering the pattern of a drop off in monthly journal response rates as cohort students entered their senior year and neared their completion data, these data demonstrate substantial progress towards increasing the number of peer tutoring and peer mentoring sessions with students.

*Preliminary Findings for Cohorts 1, 2, 3, and 4 in Project Year 4: Performance Measure 12d*
With respect to the fourth and final performance measure (12d), which evaluates the quality of peer-peer interaction, the interview data reveal a peer environment conducive to meaningful connections. AIMS[2] students spent substantial time on campus and with each other in AIMS[2] cohorts. These cohorts appeared to function as a sort of peer support network, where students found a group of allies in a new campus environment that can be challenging after transferring from a community college. AIMS[2] cohorts may have mitigated a sense of isolation as a computer information technology major and a military veteran shared: "When I first got here, I felt like I kind of had to go out and meet people and make friends. Here in AIMS it was like you already have people; it's easier for you to make friends. I know their names. It's easier to talk to them and talk about some troubles that you're having." An AIMS[2] faculty mentor in computer science shared her impression of the peer environment: "They have created a great environment of collaboration." Another faculty mentor in electrical engineering agreed, noting in a journal entry: "As a group the cohort is bonding and com[m]unicating amongst themselves to help each other." In contrast, within AIMS[2] cohorts, participants generally found themselves surrounded by peers with similar pre-college backgrounds (i.e., working-class Latino/a communities and immigrant parents), including students who shared their value for education, academic training, and career preparation in engineering or computer science fields. A computer science major spoke to this point: "The first semester I didn't talk to anybody, but with AIMS there were people I could relate to that were interested in the same stuff that I was. There is a sense of community. Once I got into AIMS it felt like I belonged here." In particular, the AIMS[2] program promotes mutually beneficial relationships between students. This can be seen in the projects and study partnerships they create. For one student, his peers in AIMS[2] helped make his academic experience more manageable: "No, it was hard. A lot of the concepts were new and I didn't know anyone so I really didn't have that much confidence. I didn't want to talk to other people or get into study groups. So the first semester, a lot of it was studying on my own until I started connecting with people in AIMS. It eventually clicked; it eventually got easier." Another student shared a similar story: "We do. We help each other whenever we have trouble with projects or homework or anything like that." Interestingly, several of these students use one another as motivators. According to one student, "I get to see most of the same students here and I get to see that they are pretty focused and dedicated toward their major. It kind of inspires me to

also be focused." One cohort student supported this statement, saying, "I feel more capable. I see that they work very hard for their major and for their career and it makes me want to work harder for my major and my career. So if they could do it, I could do it." Yet another student echoed this sentiment, citing a specific cohort member: "I've taken a lot of classes with him so we studied together a lot and he's pretty motivated and really wants to succeed. It helps me also to succeed because he always wants study." Overall the program fosters a sense of community rather than competition. As one student stated, "I don't feel like I'm competing with them [peers]. I feel like we're motivating each other and pushing each other to do even better." And another said, "I feel like the AIMS program has given us that little step in the right direction for making connections." And many students spoke about friends they made through the program being beneficial. One student explained, "…that's what's going to help me: my friends and being comfortable in this environment, I guess." While another shared that, "I met some really nice friends and we got together to study and we're constantly talking about either school-related things or about our own lives." Finally, one student described the benefit of this environment when they said, "With the friend that was in my class, [redacted] would help me with the material and then after learning the material I would think that this wasn't so bad like I can definitely do this."

Another notable facet of the peer-peer interaction within AIMS$^2$ includes the effectiveness of the peer tutors and advisors. These individuals hold valuable institutional knowledge that aids cohort participants as they progress through their undergraduate education. As we heard in the interviews, advisors answer practical questions ("I would ask her questions like, 'How did you apply? What did they ask you?'"), offer encouragement ("It's just the thought of someone saying you can do it and keep doing it. Eventually it's going to come to you. It motivates you to do better"), and even listen to mundane details about life outside of school. And the tutors were able to direct students to valuable resources. For example, one student explained, "Well she was my mentor and also my tutor. I was telling her that I was having trouble buying books and stuff and she was like, 'well you should apply here. They give you money to buy books.'" The tutors also appear to be especially dedicated to the AIMS$^2$ students. Illustrating this point, one participant remarked, "The tutors were there if you ever had trouble. You could call them up and set up an appointment to go over your homework or prep for a test or something. Actually, I have a few of them in my phone." While another participant noted, "[redacted] was the tutor that helped me out a lot. He also gave me advice too like who to take, how to get A's and stuff." Furthermore, as AIMS$^2$ students with senior-standing *and* who shared similar cultural experiences, peer tutors and mentors generally related well to student participants. In interviews, participants revealed having an easier time sharing information with their peer tutors and mentors than their faculty advisors. A mechanical engineering major spoke to this issue when he said, 'I would go see my tutor and he would always help me a lot. I think a lot of people go to the professors, but I feel way more comfortable asking a student. It's different because it's a student—you're not talking to a teacher. We talk about different things. When you go to a professor you just ask him a question and that's it. It might be awkward in some situations. With the tutor, you can be there for hours just talking about other stuff and then go back to the material." The "different things" and "other stuff" seemed to make a meaningful difference to this student and other AIMS$^2$ students in their work with peer tutors and mentors.

Nevertheless, a few students vocalize some challenges integrating with their peers. For example, one student expressed, "I don't think knowing the right people has helped. I don't know anyone." Additionally, AIMS$^2$ participants recognize that some of their peers prefer to keep a distance. On this point, a participant said, "I think it's just some of them don't want to make those connections. Even in our group we have people who do want to work with others and people who don't want to work with others. You can't really force either one, you just kind of see who wants to and that's about it." And another student flatly stated, "It sounds a little bad but I'm not here to make friends."

Clearly, though, the peer-peer environment within AIMS$^2$ generally fosters a positive academic experience. As one student put it: "At first, [I had] culture shock, but now I feel more at home because everybody is in the same place as me. Like we are all new to this kind of thing so it feels good." And, as one faculty mentor summarized: "In some respects, this program is effective because people tend to be more productive and motivated to do research (or do well in classes) if they have someone to work with, someone they can relate to, or someone they may have known from the community college."

<u>Description of Project Activities Related to the Objective</u>
During the grant period, project faculty and staff worked to meet these four project measures of this objective. Specifically, we formed Cohort 1 in Spring 2012, Cohort 2 in Fall 2012, Cohort 3 in Fall 2013, Cohort 4 in Spring 2014, Cohort 5 in Fall 2014, Cohort 6 in Fall 2015, and Cohort 7 in Fall 2016. To support the development of a quality peer environment and frequent peer-peer interaction, we developed both a peer-tutoring component and a peer-mentoring component to the project and hoped to foster peer interaction through both peer- and faculty-mentors. In particular, we continued to advertise, recruit, hire, and train peer tutors from CSUN's upper-division undergraduate and graduate students in the College of Engineering and Computer Science. In addition to peer tutoring, we conducted training of peer mentors for cohort participants. Finally, to facilitate a strong environment connected to both instructional and faculty research activities, faculty mentors facilitated weekly small group mentor sessions with cohort participants during each performance period. In addition to supporting student-faculty interaction and student development,

these sessions were intended to facilitate peer-peer interaction.  Finally, project faculty and staff planned project activities to encourage peer interactions, including on- and off-campus projects and events. These included an introduction to an appropriate professional society student chapter in the discipline and related activities – technical talks, presentations, student chapter activities etc. and visits with the cohort students from Glendale Community College and College of the Canyons.  Finally, the iPad initiative appears to have facilitated contact between peers.  First, we should note that iPads were only provided in the second, third, fourth, and fifth project years, and consequently Cohort 7 participations did not receive an iPad.  Also, data collection on iPad use did not begin until the third project period.  Yet when we review iPad use across the cohorts, we see that all cohorts with recorded iPad use reported using the iPad 3,887 times during the month of October during the project period.  For a complete picture of iPad use during the project period, please see the table of distribution of iPad use by cohort and month below:

iPad Use by Month and Cohort, AIMS[2] Cohort Participants, Cohorts 2, 3, 4, 5 and 6, October 2011-September 2017

| Month<br>Project Yr/Cohort | Oct | Nov | Dec | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | TOTAL |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 1/1 | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- |
| 2/1 | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- |
| 2/2 | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- |
| 3/2 | 1870 | 770 | 1401 | 1470 | 765 | 1527 | 1462 | 1251 | 395 | 366 | 1028 | 1060 | **13365** |
| 3/3 | 210 | 270 | 115 | 212 | 1132 | 72 | 1221 | 1053 | 5 | 122 | 1047 | 95 | **5554** |
| 4/3 | 1104 | 1045 | 35 | 55 | 50 | 135 | 1085 | 22 | 0 | 0 | 0 | 0 | **3531** |
| 4/4 | 333 | 1265 | 214 | 190 | 280 | 116 | 1352 | 270 | 35 | 129 | 274 | 1116 | **5574** |
| 5/4 | 175 | 270 | 110 | 104 | 39 | 0 | 123 | 0 | 0 | 0 | 0 | 0 | **821** |
| 5/5 | 123 | 35 | 30 | 20 | 80 | 15 | 0 | 0 | 36 | 0 | 0 | 0 | **339** |
| 6/5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | **0** |
| 5/6 | 42 | 84 | 0 | 5 | 99 | 65 | 23 | 50 | 30 | 13 | 0 | 35 | **446** |
| 6/6 | 30 | 45 | 0 | 52 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | **127** |
| 6/7 | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- | -- |
| TOTAL | 3887 | 3784 | 1905 | 2108 | 2445 | 1930 | 5266 | 2646 | 501 | 630 | 2349 | 2306 | 29757 |

Not surprisingly, looking at iPad use across all cohorts, the peak months for iPad use among students included October through November and April through May (with April the highest recorded month in the period).  When we explore how students used the iPad, we find that they reported academic and social functions that support their work as students.  One student shared: "The ipad has become integral to my academic life.  It houses all my notes, assignments, appointments, and even textbooks." Another student noted, "My iPad has drastically improved my academic experience. I can do all my homework on my iPad and read all my books. Also, I found a way to use, programs typically used on PC's, on my iPad."  Finally, a student detailed: "I am very fortunate to have the iPad. It has been extremely useful. I use it daily to access information including classes, books, research, etc. I have transitioned to using it to take notes for several classes."  Further, some students reported using the iPad for specific engineering and math applications.  On this note, a student described: "I've been using "computer networking" app lately. It gives me lots of information about Cisco, preparing me to get a Cicso certificate." Another student shared, "I've found a few apps that have made note taking quicker and easier allowing me to consolidate notes and wirelessly share them with peers. I've also found fast math apps that make mathematical calculations quicker when doing lab reports."  Beyond general academic and specific engineering and math functions, students report iPad use for communication and social reasons.  Here, one student noted, "My iPad is so useful. I take it will me to school everyday and I use it everyday for both recreational and academic purposes.  I use it everyday to communicate via email to my professors and peers. In fact I'm using my iPad to fill out this journal entry right now." Another student shared: "The most useful thing I use my iPad for is to check Moodle for anything new my professors post. It allows me to keep updated for anything new that my professors want us to have access to. Almost all of my professors use moodle and it helps me keep on top of my studies and keep in contact with my professors."  Finally, a student detailed how he or she used the iPad for "emails, networking with others, note-taking, saving pictures of the board for later reference, and lately, for sharing those special moments such as graduation pictures in social networks."

**Plans to Use of Performance Data to Monitor Progress**
With monthly student journaling during the performance period and student interviews during the fourth year, we have reported actual performance data for all four measures in the performance report for the grant period.  We have used results from data collection in both Moodle and interviews to monitor progress on all four

**performance measures related to this objective. In particular, we have used Moodle cohort participant journal results to assess further progress on the first performance three measures (12a-12c) and student interviews to evaluate progress on the final performance measure (12d).**
